## Engineering

### Unit 4: Applied Engineering Systems Candidate Brief

June 2017 Series

Paper Reference

**6934/01**

**You do not need any other materials.**

#### Advice to Candidates

- This brief is the **only** vehicle for the assessment of this unit.
- Apart from this document there will be **no examination paper** for this unit.
- Candidates' work must be carried out individually in a suitable environment, such as the workshop, and under strictly controlled/managed conditions.
- The three activities may be started at anytime after the brief has been published on the Pearson website, at the centre's discretion.
- Candidates should spend no more than a total of ten hours in completing the three activities.
- You must enter your details and sign and date the candidate authentication document stating it is your own work.
- The task labelled with an **asterisk (\*)** is the one where the quality of your written communication will be assessed.

#### Advice to Centre Staff

- The evidence to be submitted for assessment must demonstrate compliance with the requirements of the assessment criteria grid.
- Assessment will be carried out by centre assessors, whose decisions will be subject to moderation by Pearson's external moderators. For this purpose, Pearson will require a sample of the candidates' work and moderation will take place during the June examination series.
- The candidates' work must be completed, assessed and submitted to the designated moderator by the end of the published deadline.
- The candidates' mark must be entered on the appropriate OPTEMS forms and returned to Pearson by the published deadline.
- **Centres should note that the marks and candidate work can only be submitted in the June examination series.**
- Centre staff must sign and date the candidate authentication document and return it with the candidate's work.
- Candidates' marks must be recorded on the Unit 4 Mark Record Sheet, which must be attached to the candidates' work when submitted to Pearson for moderation. This form can be found on page 7 of the Candidate Brief.

## Practical activity brief

### Activity 1

It is important for engineers to know the forces acting in members of load bearing structures and the strength of the materials from which they are made. In this activity you will be asked to carry out a destructive tensile test on a structural material to determine its load bearing properties. You will also be asked to analyse a loaded framed structure to determine how its members react and whether it is in a safe condition.

You are required to complete the following tasks and submit evidence of your work.

#### Task (a) (i)

Measure and record the behaviour of a standard sample of a known metal by subjecting it to a destructive tensile test.

Produce a load/extension graph for the metal and record the dimensions of the sample.

State the type of metal you have tested.

(5)

#### Task (a) (ii)

Plot a graph of stress versus strain, and from it determine:

- the ultimate tensile strength of the metal
- the modulus of elasticity of the metal.

Compare these values with the published data for the metal. (Note that it is quite reasonable for your values to vary by 20% or more from the known values, owing to factors such as slight variations in the composition of the metal).

(4)

The simple framework shown in Figure 1 is made from rods of circular cross section of the metal you have tested. It is fixed at D and F to a wall with simple pinned joints. A load ( $W$ ) of 1.2 tonnes is supported at E.

**Figure 1**

**Task (a) (iii)**

Determine the magnitudes and nature of the forces in all members of the structure.

(3)

**Task (a) (iv)**

Assuming a factor of safety of 12, calculate a suitable diameter for member EF.

(2)

**Task (a) (v)**

Determine the change in length of the member EF as a result of the load.

You may assume that the modulus of elasticity of the metal is the same in tension and compression.

(2)

**(Total for Activity 1 = 16 marks)**

---

## Activity 2

Electro-mechanical systems are found in everyday life. They include industrial and domestic appliances, power tools and automated machinery. In this activity you will be asked to explain the function and investigate the design of an electro-mechanical system.

**Figure 2**

**Figure 2** shows an angle grinder for use in an engineering fabrication workshop. The motor is electrically powered which rotates the grinding wheel.

You are required to complete the following tasks and submit evidence of your work.

### Task (b)

Explain the purpose and function of the angle grinder shown in **Figure 2**.

(6)

### Task (c)

Investigate the construction and operation of the angle grinder and explain, with the aid of a block diagram, how its subsystems and components are connected.

Your diagram should clearly show:

- the connecting pathways
- the input and output of each block
- any energy transfers and conversions that take place.

(10)

### Task (d)

Provide an alternative design solution that fulfils the basic function of the angle grinder.

(6)

**(Total for Activity 2 = 22 marks)**

---

### Activity 3

Control systems are used in many different ways to help monitor, control or facilitate everyday operations.

In this activity you are asked to design a suitable system which fulfils the requirements of the given design brief.

#### Design brief

A coffee producer requires an automatic system that will fill glass jars with coffee granules:

- 100g of coffee must be released into each glass jar
- an empty jar weighs 300g.

Design an automatic monitoring and weighing system to ensure that a full coffee jar weighs between 400g and 405g.

The system must:

- identify and weigh every 100th filled coffee jar
- use a negative feedback system to control the flow of coffee granules to ensure the total weight of a jar when filled, is between 400g and 405g.

#### \*Task (e)

Produce a feasible design solution for the system which should include:

- a block diagram showing all system elements (4)
- signal pathways, inputs and outputs (3)
- a detailed explanation of how your system functions, including how the system counts the number of filled jars and how each jar is removed and weighed automatically (5)
- how it meets the requirement of the design brief and takes into account health and safety considerations (2)
- details of the sensors, transducers and any display equipment required for the system. (4)

#### Task (f)

Select suitable materials and components for your design which take into account:

- production constraints
- safety considerations. (4)

---

**(Total for Activity 3 = 22 marks)**

---

**TOTAL FOR PAPER = 60 MARKS**

## Authentication Statement

### Authentication Statement GCE Engineering External Test

The statement below **MUST** be completed for each candidate where a unit test specifies that a candidate's work must be handed in with the question paper. Failure to do so will result in the candidate receiving **zero marks** for the whole test.

<b>Unit Number</b>	6934
<b>Unit Name</b>	Applied Engineering Systems
<b>Level</b>	Advanced

### Candidate's Declaration

**I certify that the work submitted for this unit is my own.**

Name of Candidate		Date	
Signature of Candidate			

### Teacher's Declaration

**I certify that the candidate named above has completed the work submitted.**

Name of Teacher		Date	
Signature of Teacher
