

**Paper Reference 9MA0 – 32**  
**Pearson Edexcel**  
**Level 3 GCE**

**Mathematics**  
**Advanced**  
**Paper 32: Mechanics**

**Friday 14 June 2019 – Afternoon**

**MATERIALS REQUIRED FOR EXAMINATION**  
**Mathematical Formulae and Statistical Tables, calculator**

**ITEMS INCLUDED WITH QUESTION PAPERS**  
**Diagram Book**  
**Answer Book**

**Q63359A**

**Candidates may use any calculator allowed by Pearson regulations. Calculators must not have the facility for symbolic algebra manipulation, differentiation and integration, or have retrievable mathematical formulae stored in them.**

## **INSTRUCTIONS**

**In the boxes on the Answer Book and on the Diagram Book, write your name, centre number and candidate number.**

**Answer ALL questions and ensure that your answers to parts of questions are clearly labelled.**

**Answer the questions in the Answer Book or on the separate diagrams – there may be more space than you need.**

**Do NOT write on the Question Paper.**

**You should show sufficient working to make your methods clear. Answers without working may not gain full credit.**

**Answers should be given to three significant figures unless otherwise stated.**

**INFORMATION**

A booklet 'Mathematical Formulae and Statistical Tables' is provided.

The total mark for this part of the examination is **50**  
There are **5** questions.

The marks for EACH question are shown in brackets  
– use this as a guide as to how much time to spend on each question.

Unless otherwise stated, whenever a value of **g** is required, take  **$g = 9.8 \text{ m s}^{-2}$** , and give your answer to either **2** significant figures or **3** significant figures.

**ADVICE**

Read each question carefully before you start to answer it.

Try to answer every question.

Check your answers if you have time at the end.

---

**Answer ALL questions.**

**Write your answers in the Answer Book.**

1. [In this question position vectors are given relative to a fixed origin  $O$ ]

At time  $t$  seconds, where  $t \geq 0$ , a particle,  $P$ , moves so that its velocity  $\underline{v} \text{ m s}^{-1}$  is given by

$$\underline{v} = 6t\underline{i} - 5t^{\frac{3}{2}}\underline{j}$$

When  $t = 0$ , the position vector of  $P$  is  $(-20\underline{i} + 20\underline{j})$  metres.

- (a) Find the acceleration of  $P$  when  $t = 4$   
(3 marks)
- (b) Find the position vector of  $P$  when  $t = 4$   
(3 marks)

(Total for Question 1 is 6 marks)

---

2. A particle, **P**, moves with constant acceleration  $(2\mathbf{i} - 3\mathbf{j}) \text{ m s}^{-2}$

At time  $t = 0$ , the particle is at the point **A** and is moving with velocity  $(-\mathbf{i} + 4\mathbf{j}) \text{ m s}^{-1}$

At time  $t = T$  seconds, **P** is moving in the direction of vector  $(3\mathbf{i} - 4\mathbf{j})$

- (a) Find the value of **T**  
(4 marks)

At time  $t = 4$  seconds, **P** is at the point **B**

- (b) Find the distance **AB**  
(4 marks)

(Total for Question 2 is 8 marks)

---

3. Refer to the diagram for Question 3 in the Diagram Book.

Two blocks, **A** and **B**, of masses  $2m$  and  $3m$  respectively, are attached to the ends of a light string.

Initially **A** is held at rest on a fixed rough plane.

The plane is inclined at angle  $\alpha$  to the horizontal ground, where

$$\tan \alpha = \frac{5}{12}$$

The string passes over a small smooth pulley, **P**, fixed at the top of the plane.

The part of the string from **A** to **P** is parallel to a line of greatest slope of the plane.

Block **B** hangs freely below **P**, as shown in the diagram.

(continued on the next page)

3. continued.

The coefficient of friction between **A** and the plane is  $\frac{2}{3}$

The blocks are released from rest with the string taut and **A** moves up the plane.

The tension in the string immediately after the blocks are released is **T**

The blocks are modelled as particles and the string is modelled as being inextensible.

(a) Show that

$$T = \frac{12mg}{5}$$

(8 marks)

(continued on the next page)

Turn over

**3. continued.**

**After B reaches the ground, A continues to move up the plane until it comes to rest before reaching P**

**(b) Determine whether A will remain at rest, carefully justifying your answer.**

**(2 marks)**

**(c) Suggest two refinements to the model that would make it more realistic.**

**(2 marks)**

**(Total for Question 3 is 12 marks)**

---

4. Refer to the diagram for Question 4 in the Diagram Book.

A ramp, **AB**, of length 8 metres and mass 20 kg, rests in equilibrium with the end **A** on rough horizontal ground.

The ramp rests on a smooth solid cylindrical drum which is partly under the ground.

The drum is fixed with its axis at the same horizontal level as **A**

The point of contact between the ramp and the drum is **C**, where **AC** = 5 metres, as shown in the diagram.

The ramp is resting in a vertical plane which is perpendicular to the axis of the drum, at an angle  $\theta$  to the horizontal, where

$$\tan \theta = \frac{7}{24}$$

(continued on the next page)

Turn over

**4. continued.**

**The ramp is modelled as a uniform rod.**

**(a) Explain why the reaction from the drum on the ramp at point C acts in a direction which is perpendicular to the ramp.**

**(1 mark)**

**(b) Find the magnitude of the resultant force acting on the ramp at A**

**(9 marks)**

**(continued on the next page)**

**4. continued.**

**The ramp is still in equilibrium in the position shown in the diagram but the ramp is not now modelled as being uniform.**

**Given that the centre of mass of the ramp is assumed to be closer to **A** than to **B**,**

**(c) state how this would affect the magnitude of the normal reaction between the ramp and the drum at **C****

**(1 mark)**

**(Total for Question 4 is 11 marks)**

---

5. Refer to the diagram for Question 5 in the Diagram Book.

The points **A** and **B** lie **50** metres apart on horizontal ground.

At time  $t = 0$  two small balls, **P** and **Q**, are projected in the vertical plane containing **AB**

Ball **P** is projected from **A** with speed  $20 \text{ m s}^{-1}$  at  $30^\circ$  to **AB**

Ball **Q** is projected from **B** with speed  $u \text{ m s}^{-1}$  at angle  $\theta$  to **BA**, as shown in the diagram.

At time  $t = 2$  seconds, **P** and **Q** collide.

Until they collide, the balls are modelled as particles moving freely under gravity.

(continued on the next page)

**5. continued.**

**(a) Find the velocity of  $P$  at the instant before it collides with  $Q$**

**(6 marks)**

**(b) Find**

**(i) the size of angle  $\theta$ ,**

**(ii) the value of  $U$**

**(6 marks)**

**(c) State one limitation of the model, other than air resistance, that could affect the accuracy of your answers.**

**(1 mark)**

**(Total for Question 5 is 13 marks)**

---

**TOTAL FOR MECHANICS IS 50 MARKS**

**END OF PAPER**
