

Programming Language Subset  
Summary of changes  
Summer 2025

Pearson Edexcel Level 1/Level 2 GCSE (9–1) in  
Computer Science Paper 2 – Application of  
Computational Thinking (1CP2/02)

# Introduction

In this document, teachers and centres are informed about the changes made to the programming language subset (PLS) document from summer 2024 to summer 2025. The main changes detailed below are:

- Clarification of the two supported dimensions.
- Angle brackets amendments.
- Change to <string>.format in String subprograms table.
- Description update for built-in subprograms table.
- Spacing before bracket amendments.

The programming language subset (PLS) document version 6 for Summer 2025 can be found [here](#).

Please see list of changes below.

<b>Version 6 (Summer 2025)</b>	
Dimensions – Page 6 Further detail provided for the two supported dimensions shown in a table.	
Dimensions The number of dimensions supported by the PLS is two.	
<structure>[<first dimension>]	Accesses an item in a one-dimensional structure
<structure>[<first dimension>] [<second dimension>]	Accesses an item in a two-dimensional structure
The PLS does not support ragged data structures. Therefore, in a list of records, each record will have the same number of fields.	
<b>Version 5 (Summer 2024)</b>	
Dimensions – Page 5	
Dimensions The number of dimensions supported by the PLS is two. The PLS does not support ragged data structures. Therefore, in a list of records, each record will have the same number of fields.	

Version 6 (Summer 2025)	Version 5 (Summer 2024)				
<p>Selection – Page 8 Angle brackets added for consistency.</p> <table border="1" data-bbox="97 286 786 421"> <tr> <td data-bbox="97 286 376 421">if &lt;expression&gt;:     &lt;command&gt;</td> <td data-bbox="376 286 786 421">If &lt;expression&gt; is true, then &lt;command&gt; is executed.</td> </tr> </table>	if <expression>: <command>	If <expression> is true, then <command> is executed.	<p>Selection – Page 7</p> <table border="1" data-bbox="823 280 1517 414"> <tr> <td data-bbox="823 280 1099 414">if &lt;expression&gt;:     &lt;command&gt;</td> <td data-bbox="1099 280 1517 414">If &lt;expression&gt; is true, then command is executed.</td> </tr> </table>	if <expression>: <command>	If <expression> is true, then command is executed.
if <expression>: <command>	If <expression> is true, then <command> is executed.				
if <expression>: <command>	If <expression> is true, then command is executed.				
<p>Iteration – Page 8 Angle brackets added for consistency.</p> <table border="1" data-bbox="97 698 786 913"> <tr> <td data-bbox="97 698 376 913">for &lt;id&gt; in &lt;structure&gt;:     &lt;command&gt;</td> <td data-bbox="376 698 786 913">Executes &lt;command&gt; for each element of &lt;structure&gt;, in one dimension.</td> </tr> </table>	for <id> in <structure>: <command>	Executes <command> for each element of <structure>, in one dimension.	<p>Iteration – Page 7</p> <table border="1" data-bbox="823 698 1517 913"> <tr> <td data-bbox="823 698 1099 913">for &lt;id&gt; in &lt;structure&gt;:     &lt;command&gt;</td> <td data-bbox="1099 698 1517 913">Executes &lt;command&gt; for each element of a data structure, in one dimension.</td> </tr> </table>	for <id> in <structure>: <command>	Executes <command> for each element of a data structure, in one dimension.
for <id> in <structure>: <command>	Executes <command> for each element of <structure>, in one dimension.				
for <id> in <structure>: <command>	Executes <command> for each element of a data structure, in one dimension.				
<p>Built-in subprograms table – Page 10 Angle brackets added for consistency.</p> <table border="1" data-bbox="97 1122 786 1379"> <tr> <td data-bbox="97 1122 376 1379">input (&lt;prompt&gt;)</td> <td data-bbox="376 1122 786 1379">Displays &lt;prompt&gt; on the screen and returns the line typed in</td> </tr> </table>	input (<prompt>)	Displays <prompt> on the screen and returns the line typed in	<p>Built-in subprograms table – Page 9</p> <table border="1" data-bbox="823 1122 1517 1379"> <tr> <td data-bbox="823 1122 1099 1379">input (&lt;prompt&gt;)</td> <td data-bbox="1099 1122 1517 1379">Displays the content of prompt to the screen and waits for the user to type in characters followed by a new line</td> </tr> </table>	input (<prompt>)	Displays the content of prompt to the screen and waits for the user to type in characters followed by a new line
input (<prompt>)	Displays <prompt> on the screen and returns the line typed in				
input (<prompt>)	Displays the content of prompt to the screen and waits for the user to type in characters followed by a new line				
<p>Built-in subprograms table – Page 10 Display replaced by screen in description.</p> <table border="1" data-bbox="97 1709 786 1856"> <tr> <td data-bbox="97 1709 376 1856">print (&lt;item&gt;)</td> <td data-bbox="376 1709 786 1856">Displays &lt;item&gt; on the screen</td> </tr> </table>	print (<item>)	Displays <item> on the screen	<p>Built-in subprograms table – Page 9</p> <table border="1" data-bbox="823 1709 1517 1856"> <tr> <td data-bbox="823 1709 1099 1856">print (&lt;item&gt;)</td> <td data-bbox="1099 1709 1517 1856">Prints &lt;item&gt; to the display</td> </tr> </table>	print (<item>)	Prints <item> to the display
print (<item>)	Displays <item> on the screen				
print (<item>)	Prints <item> to the display				

## Version 6 (Summer 2025)

String subprograms table - Page 12

Angle brackets added for consistency.

Changes to <string>.format

Subprogram	Description
len (<string>)	Returns the length of <string>
<string>.find (<substring>, <start>, <end>)	Returns the location of the first instance of <substring> in the original <string>, reading from left to right. <start> is the index to begin the find. The default is zero. <end> is the index to stop the find. The default is the end <string>. Returns -1, if not found.
<string>.index (<substring>, <start>, <end>)	Returns the location of the first instance of <substring> found in the original <string> as read from left to right. Raises an exception if not found. <substring> is required. <start> and <end> are optional. The default value for <start> is zero. The default value for <end> is the end of <string>.
<string>.isalpha ()	Returns True, if all characters are alphabetic A–Z
<string>.isalnum ()	Returns True, if all characters are alphabetic A–Z or digits 0–9
<string>.isdigit ()	Returns True, if all characters are digits 0–9, exponents are digits
<string>.replace (<s1>, <s2>)	Returns original <string> with all occurrences of <s1> replaced with <s2>
<string>.split (<char>)	Returns a list of all substrings in original <string>, using <char> as the separator
<string>.strip (<char>)	Returns original <string> with all occurrences of <char> removed from the front and back
<string>.upper ()	Returns original <string> in uppercase
<string>.lower ()	Returns original <string> in lowercase
<string>.isupper ()	Returns True, if all characters in <string> are uppercase
<string>.islower ()	Returns True, if all characters in <string> are lowercase
<string>.format (<values>)	Formats <values> and puts them into <string>. The content of <string> is described by symbols and placeholders.

Subprogram	Description
<code>len (&lt;string&gt;)</code>	Returns the length of <string>
<code>&lt;string&gt;.find (&lt;substring&gt;, &lt;start&gt;, &lt;end&gt;)</code>	Returns the location of the first instance of <substring> in the original <string>, reading from left to right. <start> is the index to begin the find. The default is zero. <end> is the index to stop the find. The default is the end of the string. Returns -1, if not found.
<code>&lt;string&gt;.index (&lt;substring&gt;, &lt;start&gt;, &lt;end&gt;)</code>	Returns the location of the first instance of <substring> found in the original <string> as read from left to right. Raises an exception if not found. <substring> is required. <start> and <end> are optional. The default value for <start> is zero. The default value for <end> is the end of the string.
<code>&lt;string&gt;.isalpha ()</code>	Returns True, if all characters are alphabetic A–Z
<code>&lt;string&gt;.isalnum ()</code>	Returns True, if all characters are alphabetic A–Z or digits 0–9
<code>&lt;string&gt;.isdigit ()</code>	Returns True, if all characters are digits 0–9, exponents are digits
<code>&lt;string&gt;.replace (&lt;s1&gt;, &lt;s2&gt;)</code>	Returns original string with all occurrences of <s1> replaced with <s2>
<code>&lt;string&gt;.split (&lt;char&gt;)</code>	Returns a list of all substrings in the original, using <char> as the separator
<code>&lt;string&gt;.strip (&lt;char&gt;)</code>	Returns original string with all occurrences of <char> removed from the front and back
<code>&lt;string&gt;.upper ()</code>	Returns the original string in uppercase
<code>&lt;string&gt;.lower ()</code>	Returns the original string in lowercase
<code>&lt;string&gt;.isupper ()</code>	Returns True, if all characters are uppercase
<code>&lt;string&gt;.islower ()</code>	Returns True, if all characters are lowercase
<code>&lt;string&gt;.format (&lt;placeholders&gt;)</code>	Formats values and puts them into the <placeholders>

Version 6 (Summer 2025)	Version 5 (Summer 2024)				
<p>Tips for using turtle - Page 15 Space before brackets added for consistency.</p> <table border="1" data-bbox="97 322 788 405"> <tr> <td>Add a line asking for keyboard input, such as <code>input ()</code>, as the last line.</td> </tr> </table>	Add a line asking for keyboard input, such as <code>input ()</code> , as the last line.	<p>Tips for using turtle - Page 14</p> <table border="1" data-bbox="828 300 1501 383"> <tr> <td>Add a line asking for keyboard input, such as <code>input()</code>, as the last line.</td> </tr> </table>	Add a line asking for keyboard input, such as <code>input()</code> , as the last line.		
Add a line asking for keyboard input, such as <code>input ()</code> , as the last line.					
Add a line asking for keyboard input, such as <code>input()</code> , as the last line.					
<p>Turtle window and drawing canvas – Page 15 Space before brackets added for consistency.</p> <table border="1" data-bbox="97 645 788 824"> <tr> <td><code>turtle.Screen ()</code></td> <td>Returns a variable to address the turtle window. Use with <code>&lt;window&gt;.setup ()</code>.</td> </tr> </table>	<code>turtle.Screen ()</code>	Returns a variable to address the turtle window. Use with <code>&lt;window&gt;.setup ()</code> .	<p>Turtle window and drawing canvas – Page 14</p> <table border="1" data-bbox="828 622 1501 801"> <tr> <td><code>turtle.Screen ()</code></td> <td>Returns a variable to address the turtle window.
