

- 7 Bamboo saw a man dressed in blue enter a shop and commit a robbery.

When asked by the police later, Bamboo said the man was dressed in black.

Explain why Bamboo's memory of the event could have changed.

You should refer to the Theory of Reconstructive Memory in your answer.

if bamboo had told someone straight away he would of said blue but because he had left it a while his brain remembered it differently its because you would of been doing other things throughout the day which makes it more unclear to remember the brain is less focused

- 8 William was talking to his friend during class when the teacher was reading out a list of words for a Spanish test, so he did not write them down.

William has just taken the test to recall the list of Spanish words and has performed poorly in the test.

Explain, using the Multi-store Model of Memory, why William performed poorly in the Spanish test.

William could not recall the words because he had not been learning them and saying them over again and because he didnt his brain couldn't think of the words as he has never processed them and it would make it more difficult.
