

(b) Explain **two** strengths of Mattéo's study.

(4)

1. Mattéo's study had high levels of reliability as he had many standardised procedures. For example, Mattéo carried out an 11-week training programme to 5 ~~part~~ patients and had the other 5 patients in a different room watching TV.
2. Mattéo's results can be applied to hospitals and other medical services on finding a treatment for prosopagnosia. This is because Mattéo increased the patient's performance on recognising faces with severe prosopagnosia.
