

(a) Explain **two** conclusions that could be made from **Figure 2** regarding the role of practice and effort in learning a new skill.

(4)

1 One conclusion that could be made from Figure 2 is practice and effort increases ability of a new skill. We know this because at the start of the week (Monday) the niece could only Juggle for 4 seconds however as she practiced and put in effort at the end of the week (Sunday) she could juggle for 14 seconds which is a better score.

2 Another conclusion that could be made regarding the role of practice and effort in learning a new skill is if no practice and effort is put in to learning the skill there will be no improvement. We know this because nephew scored 4 on Monday and 4 on Sunday which is no improvement.
