GCSE (9-1) Statistics

Sample Assessment Materials
Pearson Edexcel Level 1/Level 2 GCSE (9-1) in Statistics (1ST0)
First teaching from September 2017
First certification from June 2019

Issue 3
**LCCI qualifications**

Edexcel, BTEC and LCCI qualifications are awarded by Pearson, the UK’s largest awarding body offering academic and vocational qualifications that are globally recognised and benchmarked. For further information, please visit our qualification website at qualifications.pearson.com. Alternatively, you can get in touch with us using the details on our contact us page at qualifications.pearson.com/contactus

**About Pearson**

Pearson is the world's leading learning company, with 35,000 employees in more than 70 countries working to help people of all ages to make measurable progress in their lives through learning. We put the learner at the centre of everything we do, because wherever learning flourishes, so do people. Find out more about how we can help you and your learners at qualifications.pearson.com

Introduction

The Pearson Edexcel Level 1/Level 2 GCSE (9–1) in Statistics is designed for use in schools and colleges. It is part of a suite of GCSE qualifications offered by Pearson. These sample assessment materials have been developed to support this qualification and will be used as the benchmark to develop the assessment students will take.
General marking guidance

These notes offer general guidance, but the specific notes for examiners appertaining to individual questions take precedence.

1 All candidates must receive the same treatment. Examiners must mark the last candidate in exactly the same way as they mark the first.

Where some judgement is required, mark schemes will provide the principles by which marks will be awarded; exemplification/indicative content will not be exhaustive. When examiners are in doubt regarding the application of the mark scheme to a candidate’s response, the response should be sent to review.

2 All the marks on the mark scheme are designed to be awarded; mark schemes should be applied positively. Examiners should also be prepared to award zero marks if the candidate’s response is not worthy of credit according to the mark scheme. If there is a wrong answer (or no answer) indicated on the answer line always check the working in the body of the script (and on any diagrams), and award any marks appropriate from the mark scheme.

Questions where working is not required: In general, the correct answer should be given full marks.

Questions that specifically require working: In general, candidates who do not show working on this type of question will get no marks – full details will be given in the mark scheme for each individual question.

3 Crossed out work

This should be marked unless the candidate has replaced it with an alternative response.

4 Choice of method

If there is a choice of methods shown, mark the method that leads to the answer given on the answer line.

If no answer appears on the answer line, then mark both methods as far as they are identical and award these marks.

5 Incorrect method

If it is clear from the working that the “correct” answer has been obtained from incorrect working, award 0 marks.

6 Follow through marks

Follow through marks which involve a single stage calculation can be awarded without working as you can check the answer, but if ambiguous do not award.

Follow through marks which involve more than one stage of calculation can only be awarded on sight of the relevant working, even if it appears obvious that there is only one way you could get the answer given.

7 Ignoring subsequent work

It is appropriate to ignore subsequent work when the additional work does not change the answer in a way that is inappropriate for the question or its context. (e.g. an incorrectly cancelled fraction when the unsimplified fraction would gain full marks).

It is not appropriate to ignore subsequent work when the additional work essentially makes the answer incorrect (e.g. incorrect algebraic simplification).
8 **Probability**

Probability answers must be given as a fraction, percentage or decimal. If a candidate gives a decimal equivalent to a probability, this should be written to at least 2 decimal places (unless tenths).

Incorrect notation should lose the accuracy marks, but be awarded any implied method marks.

If a probability fraction is given then cancelled incorrectly, ignore the incorrectly cancelled answer.

9 **Range of answers**

Unless otherwise stated, when an answer is given as a range (e.g. 3.5 – 4.2) then this is inclusive of the end points (e.g. 3.5, 4.2) and all numbers within the range.

**Guidance on the use of abbreviations within this mark scheme**

- **M** method mark awarded for a correct method or partial method
- **A** accuracy mark (awarded after a correct method; if no method or process is seen then full marks for the question are implied but see individual mark schemes for more details)
- **B** unconditional accuracy mark (no method needed)
- **oe** or equivalent
- **cao** correct answer only
- **ft** follow through (when appropriate as per mark scheme)
- **sc** special case
- **dep** dependent (on a previous mark)
- **indep** independent
- **awrt** answer which rounds to
- **isw** ignore subsequent working
Instructions

- Use black ink or ball-point pen.
- Fill in the boxes at the top of this page with your name, centre number and candidate number.
- Answer all questions.
- Answer the questions in the spaces provided – there may be more space than you need.
- Scientific calculators may be used.
- You must show all your working out with your answer clearly identified at the end of your solution.

Information

- The total mark for this paper is 80.
- The marks for each question are shown in brackets – use this as a guide as to how much time to spend on each question.

Advice

- Read each question carefully before you start to answer it.
- Try to answer every question.
- Check your answers if you have time at the end.
1. The incomplete pictogram shows the numbers of hours that Milly spent studying Biology, English and French.

<p>| | | | | |</p>
<table>

<td></td>
</tr>
</tbody>
</table>

Milly spent 6 hours studying Maths.

(a) Complete the pictogram for Maths.  

(1)

Milly spent more hours studying English than she spent studying Biology.

(b) Work out how many more hours.

....................................................... hours  

(2)

Milly’s teacher wants her to spend a total of more than 20 hours studying.

(c) Has Milly spent a total of more than 20 hours studying?  
Give a reason for your answer.

...................................................................................................................................................................................................................................................

...................................................................................................................................................................................................................................................

...................................................................................................................................................................................................................................................

(2)

(Total for Question 1 is 5 marks)
2 Ramon uses 10 letter cards to spell the word **STATISTICS**.

Ramon takes one of these cards at random.

(a) On the probability scale, mark with a cross (×) the probability that the letter on the card is **S**.

(b) On the probability scale, mark with a cross (×) the probability that the letter on the card is **Z**.

(c) On the probability scale, mark with a cross (×) the probability that the letter on the card is **not C**.

(Total for Question 2 is 3 marks)
3 Leyla wants to find out how often people in her town eat in a restaurant.

She asked a sample of 30 people how many times they had eaten in a restaurant during the last week.

Here are Leyla’s results.

\[
\begin{array}{ccccccccccc}
3 & 4 & 2 & 1 & 1 & 5 & 1 & 1 & 1 & 2 \\
2 & 1 & 2 & 1 & 1 & 2 & 5 & 1 & 3 & 1 \\
1 & 4 & 3 & 3 & 1 & 4 & 2 & 1 & 1 & 2 \\
\end{array}
\]

(a) Fill in the tally chart for this information and complete the frequency column.

<table>
<thead>
<tr>
<th>Number of times</th>
<th>Tally</th>
<th>Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td></td>
<td></td>
</tr>
<tr>
<td>2</td>
<td></td>
<td></td>
</tr>
<tr>
<td>3</td>
<td></td>
<td></td>
</tr>
<tr>
<td>4</td>
<td></td>
<td></td>
</tr>
<tr>
<td>5</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

(2)

(b) Write down the mode.

.....................................................

(1)

(c) Work out the number of people in Leyla’s sample who had eaten in a restaurant fewer than 4 times during the last week.

.....................................................

(2)

(d) Suggest a suitable diagram that Leyla could use to represent her data.

.....................................................

(1)

(Total for Question 3 is 6 marks)
A researcher is investigating how much the employees at a large company are paid. One hypothesis she investigates is

“Men are paid more than women”.

The researcher could find it difficult to collect information to test her hypothesis.

(a) Give one difficulty the researcher could have when trying to find out how much each employee is paid.

(b) State the population for this investigation.

(c) (i) Explain the difference between primary data and secondary data.

(ii) The researcher plans to collect primary data. Give a reason why.

The researcher plans to give a questionnaire to 60 employees of the company.
She asks the first 30 males and the first 30 females who come into work one morning to complete her questionnaire.

(d) Give one advantage and one disadvantage of this sampling method.

Advantage

Disadvantage

(Total for Question 4 is 7 marks)
5 Zander spins a fair 4-sided spinner.

(a) Write down the probability that the spinner lands on 1

Zander now spins the spinner 60 times.
(b) Work out the expected number of times the spinner will land on 1

Helen spins a biased 3-sided spinner 45 times.
On each spin, the spinner can land on 1 or on 2 or on 3
Here are her results.

<table>
<thead>
<tr>
<th>Number</th>
<th>Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>7</td>
</tr>
<tr>
<td>2</td>
<td>9</td>
</tr>
<tr>
<td>3</td>
<td>29</td>
</tr>
</tbody>
</table>

Helen is going to spin the 3-sided spinner again.
(c) Use the results in the table to find an estimate that the spinner will land on 2 or on 3

Helen concludes that the 3-sided spinner is most likely to land on a score of 3 the next time it is spun.
(d) Comment on the reliability of Helen’s conclusion.

(Total for Question 5 is 7 marks)
6 Richard works in an animal rescue centre.

Richard has collected data on the weights, in kilograms, of 10 male cats and the weights, in kilograms, of 10 female cats at the centre.

<table>
<thead>
<tr>
<th>Male</th>
<th>3.0</th>
<th>3.2</th>
<th>3.3</th>
<th>3.5</th>
<th>3.6</th>
<th>3.8</th>
<th>3.9</th>
<th>4.2</th>
<th>4.4</th>
<th>4.9</th>
</tr>
</thead>
<tbody>
<tr>
<td>Female</td>
<td>3.0</td>
<td>3.1</td>
<td>3.1</td>
<td>3.2</td>
<td>3.3</td>
<td>3.3</td>
<td>3.5</td>
<td>3.7</td>
<td>3.9</td>
<td>9.5</td>
</tr>
</tbody>
</table>

Richard wants to compare the average weight of the male cats with the average weight of the female cats.

Richard thinks that he should use either the mean or the median.

(a) Which one of the mean or the median do you think he should use?
   Give a reason for your answer.

(b) Richard plans to use a scatter diagram in order to compare the weights of the male cats with the weights of the female cats.

(b) Discuss whether or not a scatter diagram would be a suitable diagram to use.

(Total for Question 6 is 4 marks)
The incomplete multiple bar chart shows information about the numbers of UK films first shown in 2013 and in 2014 for some types of film.

(Source: BFI Statistical Yearbooks)

9 UK action films were first shown in 2013
7 UK action films were first shown in 2014

(a) Complete the multiple bar chart.

(b) Which two types of film?

........................................................................................................
........................................................................................................

(c) Work out the total number of drama films that were first shown in these two years.

........................................................................................................

(d) Compare the numbers of UK films of the different types that were first shown in 2013 with those first shown in 2014
..................................................................................................................................................................................................................................................
..................................................................................................................................................................................................................................................
..................................................................................................................................................................................................................................................
..................................................................................................................................................................................................................................................

(e) Explain why it would not be appropriate to display the information from the multiple bar chart in a time series graph.
..................................................................................................................................................................................................................................................
..................................................................................................................................................................................................................................................

(Total for Question 7 is 7 marks)
The incomplete multiple bar chart shows information about the numbers of UK films first shown in 2013 and in 2014 for some types of film.

<table>
<thead>
<tr>
<th>Type of film</th>
<th>Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>Drama</td>
<td></td>

<tr>
<td>Documentary</td>
<td></td>
</tr>
</tbody>
</table>

(Source: BFI Statistical Yearbooks)

9 UK action films were first shown in 2013
7 UK action films were first shown in 2014

(a) Complete the multiple bar chart.

(b) The number of UK films first shown in 2013 was 17 for two types of film.
Which two types of film?

(c) Work out the total number of drama films that were first shown in these two years.

(d) Compare the numbers of UK films of the different types that were first shown in 2013 with those first shown in 2014

(e) Explain why it would not be appropriate to display the information from the multiple bar chart in a time series graph.

(Total for Question 7 is 7 marks)
The bar chart gives information about the amounts of different types of fuel, in Mtoe (millions of tonnes of oil equivalent), that were used in the United Kingdom in the year 2000.

Ignoring ‘other fuels’,

(a) write down the type of fuel that used the least amount of Mtoe in the year 2000

.................................................................................................................................................................................................................................................................................................................................................................................................................................................................................................................................

(1)

One type of fuel used one quarter of the amount of Mtoe used by natural gas in the year 2000

(b) Which type of fuel was this?

.................................................................................................................................................................................................................................................................................................................................................................................................................................................................................................................................

(1)
The pie chart shows information about the amounts of different types of fuel, in Mtoe, that were used in the United Kingdom in the year 2013.

The amount of natural gas used, in Mtoe, was the greatest in both 2000 and 2013.

(c) Explain how the bar chart and the pie chart show this.

Juanita says that more diesel was used in 2013 than in 2000.

(d) Explain whether or not the information given in the two diagrams can be used to support this statement.

(Total for Question 8 is 5 marks)
9 The directors of a company want to make changes to the company’s pension scheme. The directors want to find out what the employees think about the proposed changes to the pension scheme. The directors will collect the information by using one of two data collection methods. **Method 1:** each employee will be interviewed by one of the directors. **Method 2:** each employee will complete a questionnaire without filling in their name. There are 100 employees in the company. Discuss how appropriate each of these two data collection methods are.

(Total for Question 9 is 4 marks)
10 The table shows information about the ages, when elected, of French presidents and UK prime ministers for the years 1850 to 2015.

<table>
<thead>
<tr>
<th></th>
<th>Lowest value</th>
<th>Lower quartile</th>
<th>Median</th>
<th>Upper quartile</th>
<th>Highest value</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>French presidents</em></td>

<td>53</td>
<td>56.5</td>
<td>63</td>
<td>70</td>
</tr>
</tbody>
</table>

(Source: Wikipedia)

Compare and interpret the spread of ages of French presidents with UK prime ministers for the years 1850 to 2015.
11 Kerry is investigating whether there is a difference in the lengths of the text messages sent by boys and sent by girls at her school.

She writes the following hypothesis for the investigation.

“The length of text messages sent by girls is greater than the length of text messages sent by boys”.

Kerry decides to use a census of the 800 students in her school. She is going to ask each student to record the number of characters in their last text message.

Kerry then collects this information from each student through an online database.

Part of the database is shown below.

<table>
<thead>
<tr>
<th>Gender</th>
<th>Length of text message</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>male 73</td>

Morgan uses these results to find estimates for all Year 11 students.

(a) Find his estimate for the number of left-handed students in Year 11

(b) Explain how Morgan can use the information in the spreadsheet to estimate the mean height of all the students in Year 11

(Total for Question 13 is 3 marks)
14 The table shows information about the retail price index (RPI) and the price of a second-class stamp (in pence) in the United Kingdom for January 1996, January 2006 and January 2016

<table>

Instructions

• Use black ink or ball-point pen.
• Fill in the boxes at the top of this page with your name, centre number and candidate number.
• Answer all questions.
• Answer the questions in the spaces provided – there may be more space than you need.
• Scientific calculators may be used.
• You must show all your working out with your answer clearly identified at the end of your solution.

Information

• The total mark for this paper is 80.
• The marks for each question are shown in brackets – use this as a guide as to how much time to spend on each question.

Advice

• Read each question carefully before you start to answer it.
• Try to answer every question.
• Check your answers if you have time at the end.
1 Jenny wants to find out what students at her school think about the after-school clubs.

Jenny is going to use a questionnaire.

Here is one of the questions she wants to put on the questionnaire.

It is great that we have a range of clubs at school, isn’t it?

Yes  No  Don’t know

(a) This is not a suitable question.

Explain why.

(b) Discuss whether or not this is a suitable question for the questionnaire.

Here is another of the questions that Jenny wants to put on the questionnaire.

How many times a week do you go to an after-school club?

1–2  2–3  4–5

(b) Discuss whether or not this is a suitable question for the questionnaire.

(Total for Question 1 is 3 marks)
2 Tom and Samira want to collect data on the numbers of hours students at their school spend on homework.

There are 1100 students at their school.

Tom is planning to use a random sample of 50 students.

(a) Explain what is meant by a random sample.

Razwan collected data about the methods used to get to work that morning by the 25 people who work at his company.

The bar chart shows information about the methods used.

(a) Which method was used by the greatest number of people?

......................................................

(1)

(b) Which method was used by half as many of the people who got to work by bus?

......................................................

(1)

Razwan concludes that travelling to work by car is the most popular method used to get to work in his city.

(c) Give one limitation of Razwan’s conclusion.

..................................................................................................................................................................................................................................................

(1)

(Total for Question 3 is 3 marks)
4 Rebecca collected information about the type of accommodation that 30 people stayed in the last time they went on holiday.

She drew this diagram to show her results.

<table>
<thead>
<tr>
<th></th>
<th>Tent</th>
<th>Caravan</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>△ △ △</td>
<td>□ □ □ □ □</td>
</tr>
</tbody>
</table>

Write down three things that could be misleading or that are wrong in Rebecca’s diagram.

1. .......................................................... ...
2. .......................................................... ...
3. .......................................................... ...

(Total for Question 4 is 3 marks)
5 Diane recorded the number of hours that she watched television each day last week.

<table>
<thead>
<tr>
<th>Number of hours</th>
<th>Monday</th>
<th>Tuesday</th>
<th>Wednesday</th>
<th>Thursday</th>
<th>Friday</th>
<th>Saturday</th>
<th>Sunday</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>2</td>
<td>1</td>
<td>2</td>
<td>0</td>
<td>4</td>
<td>6</td>
<td>6</td>
</tr>
</tbody>
</table>

(a) Draw a line graph for this data.

Label each axis.

(b) Calculate the mean number of hours.

..................................................................................................................................................................................................................................................
..................................................................................................................................................................................................................................................
..................................................................................................................................................................................................................................................

(3)

(c) Find the median.

..................................................................................................................................................................................................................................................

(2)

(d) Use your answers to part (b) and part (c) to compare the average amount of television watched by Diane and by Noah last week.

..................................................................................................................................................................................................................................................
..................................................................................................................................................................................................................................................
..................................................................................................................................................................................................................................................

(2)

(Total for Question 5 is 9 marks)
Noah recorded the number of hours that he watched television each day last week.

He calculated the mean and the median of his results.

<table>
<thead>
<tr>
<th>Number of hours</th>
<th>Mean</th>
<th>Median</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>4</td>
<td>1</td>
</tr>
</tbody>
</table>

(d) Use your answers to part (b) and part (c) to compare the average amount of television watched by Diane and by Noah last week.

(Total for Question 5 is 9 marks)
6 Claire collected data on the weights of the England football team and the weights of the England rugby team from the internet.

She calculated the mean and range of the weights of each team. Her results are shown in this table.

<table>
<thead>
<tr>
<th></th>
<th>Mean</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Football team</td>
<td>77.0 kg</td>
<td>30 kg</td>
</tr>
<tr>
<td>Rugby team</td>
<td>104.6 kg</td>
<td>42 kg</td>
</tr>
</tbody>
</table>

(Sources: thefa.com and englandrugby.com)

(a) State **two** possible problems with obtaining data from the internet.

(b) Use the information in the table to compare the distribution of weights of the England football team with the weights of the England rugby team.

Interpret your comparison.

(c) Suggest a possible problem with collecting primary data in this situation.

(Total for Question 6 is 6 marks)
This question must be answered with a cross in a box ☑. If you change your mind about an answer, put a line through the box ✗ and then mark your new answer with a cross ☑.

7 Raina has been watching the judging of a cake baking competition.

Two judges ranked the 10 bakers for their sponge cakes.

Raina calculated the Spearman’s rank correlation coefficient for the ranks given by the judges.

She got a value of 0.8

(a) (i) What type of correlation is shown by the value 0.8?
   Put a cross in one of the boxes below.

   Negative correlation ☐   No correlation ☐   Positive correlation ☑

   (ii) Interpret Raina’s value.

   The same two judges will also be judging a flower-arranging competition.

   (b) Is it possible to say anything about the ranks they are likely to give for
   flower arranging based on the value of Spearman’s rank correlation coefficient that
   Raina calculated?

   Give a reason for your answer.

   (Total for Question 7 is 3 marks)
The maximum temperature (°C) and the number of hours of sunshine were recorded in Sheffield each day in July for 11 successive years.

For each July, the mean maximum temperature and the total number of hours of sunshine were calculated.

The scatter diagram shows this information.

In one of these years there was a total of 244 hours of sunshine in July.

(a) For this year, write down the mean maximum temperature.

...................................................... °C

(1)

(b) For the year with the lowest total number of hours of sunshine in July, write down the mean maximum temperature.

...................................................... °C

(1)

(c) Draw a line of best fit on the scatter diagram.

(1)
(d) Describe and interpret the type of correlation shown by the scatter diagram.

..................................................................................................................................................................................................................................................
..................................................................................................................................................................................................................................................
..................................................................................................................................................................................................................................................
..................................................................................................................................................................................................................................................
..................................................................................................................................................................................................................................................

(3)

For a different year in Sheffield, there was a total of 220 hours of sunshine in July.

(e) (i) Estimate the mean maximum temperature for July that year.

.............................................................................................................................................................................................................................................................................. °C

(ii) Give a reason why your answer to part (e)(i) should be reliable.

..............................................................................................................................................................................................................................................................................
..............................................................................................................................................................................................................................................................................

(2)

(Total for Question 8 is 8 marks)
9 The time series graphs show information about the numbers of students taking A Level Physics and A Level French in each of the years from 2008 to 2016.

(a) Work out an estimate for the difference in the number of students taking A Level Physics and the number of students taking A Level French in the year 2008.

(2)

(b) Explain why the answer to part (a) is an estimate.

(1)

(c) Describe the trend in the number of students taking A Level French from 2008 to 2016.

(1)
Alizee is going to give a presentation to students at a school. She wants to show her target audience that Physics is the most popular subject at A Level.

(d) Explain whether or not it would be appropriate for Alizee to use the time series graph to show this.

Ivan is going to give a presentation to students at a school. He wants to show his target audience that the number of students taking A Level Physics is decreasing.

(e) Explain how Ivan can use information from the time series graph to show this.

Lionel wants to use the time series graphs to predict the number of students taking A Level Physics and the number of students taking A Level French in 2020

(f) Discuss whether or not it would be appropriate to do so.
27 adults were each asked to count the number of times they could bounce a ball on a bat.

Here are the results.

5  8  13  5  7  23  30  6  21  
24  23  22  13  9  12  6  12  34  
22  20  35  22  12  16  24  13  12  

(a) Complete the stem and leaf diagram for this information.

```
0
1
2
3
```

Key: 0 | 5 represents 5 bounces

(b) Work out the interquartile range of the results.

...................................................... (2)

The median of the results for 27 children is 9
The interquartile range of the results for these children is 6
Alex thinks these results show that adults are better than children at bouncing a ball on a bat.

(c) Do you agree with Alex?
You must give reasons for your answer.

..................................................................................................................................................................................................................................................
..................................................................................................................................................................................................................................................
..................................................................................................................................................................................................................................................
..................................................................................................................................................................................................................................................
....................................................................................................................................................................................................................................................................... (3)
27 adults were each asked to count the number of times they could bounce a ball on a bat.

Here are the results.

5 8 13 5 7 23 30 6 21 24 23 22 13 9 12 6 12 34 22 20 35 22 12 16 24 13 12

(a) Complete the stem and leaf diagram for this information.

(b) Work out the interquartile range of the results.

(c) Do you agree with Alex?
   You must give reasons for your answer.

The median of the results for 27 children is 9

The interquartile range of the results for these children is 6

Alex thinks these results show that adults are better than children at bouncing a ball on a bat.

You must give reasons for your answer.

(Total for Question 10 is 7 marks)
Archaeologists divided a field into 36 squares of equal size.

The number of Roman roof tiles found in each square was recorded.

The choropleth map below was drawn using this information.

Use the choropleth map to describe where in the field the greatest number of roof tiles was found.

Give a statistical reason for your answer.

(Total for Question 11 is 2 marks)
12 Tomoyo found the weight, in grams, of each of 100 cherries.

(a) Circle the two words from the list that best describe the data Tomoyo found.

quantitative qualitative discrete continuous bivariate ordinal categorical

Tomoyo grouped the weights and she then drew this diagram for her results.

![Histogram of cherry weights](image)

The incomplete frequency table shows some information about her results.

<table>
<thead>
<tr>
<th>Weight (w grams)</th>
<th>Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>$1 \leq w &lt; 3$</td>
<td>10</td>
</tr>
<tr>
<td>$3 \leq w &lt; 5$</td>
<td></td>
</tr>
<tr>
<td>$5 \leq w &lt; 7$</td>
<td></td>
</tr>
<tr>
<td>$7 \leq w &lt; 9$</td>
<td></td>
</tr>
</tbody>
</table>

(b) (i) Complete the frequency column in the table.

(ii) Calculate an estimate of the mean weight of the 100 cherries.

\[ \text{Mean weight} = \frac{\text{Total weight}}{\text{Number of cherries}} \]

\[ \text{Total weight} = \text{Weight (grams) \times Frequency} \]

\[ \text{Total weight} = 1 \times 10 + 3 \times 3 + 5 \times 7 + 7 \times 9 \]

\[ \text{Total weight} = 10 + 9 + 35 + 63 = 117 \]

\[ \text{Mean weight} = \frac{117}{100} = 1.17 \text{ g} \]

(Total for Question 12 is 7 marks)
13 $X$ and $Y$ are two events.

The Venn diagram shows information about the probabilities of events related to $X$ and $Y$ happening.

(a) Find

(i) the probability of event $Y$ happening

(ii) $P(X$ and $Y)$

(iii) $P(Y \mid X)$

Two different events $A$ and $B$ are independent

$P(A) = 0.8$ and $P(B) = 0.5$

(b) Find $P(A$ and $B)$

(Total for Question 13 is 6 marks)
14 Gary is going to investigate the amounts of time students spend watching TV.

He is going to write a plan for this investigation.

His hypothesis is

“The amount of time that boys spend watching TV is greater than the amount of time that girls spend watching TV”.

Write down three other things he should include in his plan.

Explain why each of these things is appropriate.

You must refer to more than one stage of the statistical enquiry cycle.

(Total for Question 14 is 6 marks)
The editor of a home magazine collects information about the types of washing machines people use. She uses statistical software to represent the results in three different ways.

**Way 1:** Table.

<table>
<thead>
<tr>
<th>Type of washing machine</th>
<th>Top loading</th>
<th>Front loading</th>
<th>Hybrid</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number owned</td>
<td>150</td>
<td>425</td>
<td>25</td>
</tr>
</tbody>
</table>

**Way 2:** Bar chart.

**Way 3:** Pie chart.
For each of the ways, comment on why the editor might choose this way to represent the results in the magazine.

Way 1

Instructions

- Use **black** ink or ball-point pen.
- **Fill in the boxes** at the top of this page with your name, centre number and candidate number.
- Answer all questions.
- Answer the questions in the spaces provided – *there may be more space than you need.*
- Scientific calculators may be used.
- You must **show all your working out** with your answer clearly identified at the **end of your solution.**

Information

- The total mark for this paper is 80.
- The marks for each question are shown in brackets – *use this as a guide as to how much time to spend on each question.*

Advice

- Read each question carefully before you start to answer it.
- Try to answer every question.
- Check your answers if you have time at the end.
Higher Tier Formulae

You must not write on this page.

Anything you write on this page will gain NO credit.

Skew = \( \frac{3(\text{mean} - \text{median})}{\text{standard deviation}} \)

\[
\text{Standard deviation} = \sqrt{\frac{1}{n} \sum(x - \bar{x})^2}
\]

An alternative formula for standard deviation is

\[
\text{standard deviation} = \sqrt{\frac{\sum x^2}{n} - \left(\frac{\sum x}{n}\right)^2}
\]

Spearman’s rank correlation coefficient

\[
r_s = 1 - \frac{6 \sum d^2}{n(n^2 - 1)}
\]

Rates of change (e.g. Birth rate = \( \frac{\text{number of births} \times 1000}{\text{total population}} \))

---

A teacher gave her students two mathematics tests on the same topics. The first test was given before revision of the topics and the second test was given after revision of the topics. The two tests had the same maximum mark and the same difficulty. The box plots give information about the students' scores in these tests.

Describe what effect the revision had on the test scores of these students. You must explain how you reach your conclusions.

(Total for Question 1 is 4 marks)
2 Kerry is investigating whether there is a difference in the lengths of the text messages sent by boys and sent by girls at her school.

She writes the following hypothesis for the investigation.

“The length of text messages sent by girls is greater than the length of text messages sent by boys”.

Kerry decides to use a census of the 800 students in her school. She is going to ask each student to record the number of characters in their last text message.

Kerry then collects this information from each student through an online database.

Some of the database is shown below.

<table>
<thead>
<tr>
<th>Gender</th>
<th>Length of text message</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>male</td>
</tr>
<tr>
<td>2</td>

<td>Rami</td>
<td>1</td>
<td>165</td>
</tr>
<tr>
<td>29</td>
<td>Youen</td>
<td>0</td>
<td>164</td>
</tr>
<tr>
<td>30</td>
<td>Elena</td>
<td>0</td>
<td>162</td>
</tr>
<tr>
<td><strong>Total</strong></td>
<td></td>
<td><strong>4</strong></td>
<td><strong>5031</strong></td>
</tr>
</tbody>
</table>

Morgan uses these results to find estimates for all Year 11 students.

(a) Find his estimate for the number of left-handed students in Year 11

(2)

(b) Explain how Morgan can use the information in the spreadsheet to estimate the mean height of all the students in Year 1

(1)

(Total for Question 4 is 3 marks)
5 The table shows information about the retail price index (RPI) and the price of a second-class stamp (in pence) in the United Kingdom for January 1996, January 2006 and January 2016

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Retail price index (RPI)</td>
<td>100</td>
<td>129</td>
<td>172</td>
</tr>
<tr>
<td>Price of second-class stamp (pence)</td>
<td>20</td>
<td>23</td>
<td>54</td>
</tr>
</tbody>
</table>

(Sources: ons.gov.uk and royalmail.com)

Describe how the increase in the price of a second-class stamp compares with the RPI over the ten years to January 2006 and over the twenty years to January 2016

(Total for Question 5 is 5 marks)
Rahul, Lisa and Paul are investigating how much the workers in a company earn. They have been told that in a week the workers earn £260 or £370 or £510

Last week
20% of the workers earned £260
35% of the workers earned £370
45% of the workers earned £510

Rahul, Lisa and Paul want to work out the average earnings for these workers last week.

Rahul thinks that they should find the mean of £260, £370 and £510
Lisa thinks that they should find the median of £260, £370 and £510
Paul thinks that they should find the weighted mean of the earnings.

(a) Which one of these three averages should they use? Give a reason for your answer.

Rahul works out that the mean of the earnings is £380
Lisa finds that the median of the earnings is £370

(b) Work out the weighted mean of the earnings for Paul.

£ .....................................................

(Total for Question 6 is 4 marks)
7 A fitness company is planning to open a new gym in a town.

The company wants to collect information about the health of people in the town.

The company plans to interview people in the town centre and ask them questions from a questionnaire.

Here are two of the questions from the questionnaire.

A   How old are you?
B   What is your weight?

Discuss whether using these questions in an interview is an appropriate way to collect this information.

(Total for Question 7 is 3 marks)
8  The table gives information about the monthly average price per litre, in pence, of diesel over a period of five months.

The table also gives some of the chain base index numbers, correct to one decimal place, for this information.

<table>
<thead>
<tr>
<th></th>
<th>May</th>
<th>June</th>
<th>July</th>
<th>August</th>
<th>September</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Monthly average price (p)</strong></td>
<td>109.1</td>
<td>111.8</td>
<td>112.7</td>
<td>111.2</td>
<td>113.1</td>
</tr>
<tr>
<td><strong>Chain base index number</strong></td>
<td></td>
<td>102.5</td>
<td>100.8</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

(Source: theaa.com)

(a) Calculate the chain base index numbers for August and September and write them in the table.
Give each value correct to one decimal place.

(b) (i) Calculate the geometric mean of the four chain base index numbers.
You must show your working.
Give your answer correct to one decimal place.

(b) (ii) Interpret your answer.

(Total for Question 8 is 6 marks)
9  Tania wants to estimate the number of snails in a pond.
   She takes a sample of 10 snails from the pond.
   She marks each snail with a waterproof dye and then puts the snail back in the pond.

   Two weeks later, Tania takes another sample of 10 snails from the pond.
   She finds that only one of the snails is marked with the dye.

   Tania says,
   “I estimate there are 100 snails in the pond.”

   How reliable is Tania’s estimate?
   Give reasons for your answer.
   You are not required to check Tania’s calculation.

..................................................................................................................................................................................................................................................

(3)

(d) Use the average seasonal effect for Quarter 1 to show that Tony’s estimate is reasonable.

Tony says, “Using the time series graph I estimate that there were approximately 7.35 million visitors to the UK in Quarter 1 of 2015.”

(e) Explain why this is appropriate.

..................................................................................................................................................................................................................................................
..................................................................................................................................................................................................................................................
..................................................................................................................................................................................................................................................
..................................................................................................................................................................................................................................................
..................................................................................................................................................................................................................................................

(1)
Tony calculates the 4-point moving averages for the information shown in the time series graph.

Here are his results.

<table>
<thead>
<tr>
<th>Year</th>
<th>Average</th>
</tr>
</thead>
<tbody>
<tr>
<td>2012</td>
<td>7.77</td>
</tr>
<tr>
<td>2013</td>
<td>7.79</td>

<td>8.45</td>
</tr>
</tbody>
</table>

(b) Plot these moving averages on the time series graph and hence draw a trend line for the number of visitors to the UK from 2012 to 2014

(c) Describe the trend.

Tony says,

“Using the time series graph I estimate that there were approximately 7.35 million visitors to the UK in Quarter 1 of 2015”.

(d) Use the average seasonal effect for Quarter 1 to show that Tony’s estimate is reasonable.

Tony calculated 4-point moving averages for the information shown in the time series graph.

(e) Explain why this is appropriate.
In a television talent contest, 9 acts were given the following ranks by the judges and by a public telephone vote.

<table>
<thead>
<tr>
<th>Act</th>
<th>Judges’ rank</th>
<th>Public vote rank</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>

<td>7</td>
</tr>
</tbody>
</table>

(a) Use calculations to determine how much agreement there is between the judges and the public.
Gurdeep was investigating the relationship between the number of points scored and the year practice started for each of 9 acts.

This is the scatter diagram he obtained using statistical software.

The statistical software also calculated two correlation coefficients.

- Spearman’s rank correlation coefficient
- Pearson’s product moment correlation coefficient

(b) (i) Circle one value in each row below to show the most likely pair of correlation coefficients for this data.

| Spearman’s rank correlation coefficient: | −0.9 | −0.7 | 0 | 0.7 | 0.9 |
| Pearson’s product moment correlation coefficient: | −0.9 | −0.7 | 0 | 0.7 | 0.9 |

(ii) Explain your choice of answers in part (i).

..................................................................................................................................................................................................................................................

(Total for Question 11 is 8 marks)
12 Rajesh is investigating to see if there is an association between the male unemployment rate and male life expectancy in the regions of England for 2014.

His hypothesis is

“Where the male unemployment rate is high, the male life expectancy is low.”

Rajesh finds the male unemployment rate (\(x\)% and the male life expectancy (\(y\) years) for each of eight of the nine regions of England for 2014.

This information is shown on the scatter diagram below.

(a) Explain, giving a statistical reason, whether or not this scatter diagram supports Rajesh’s hypothesis.
The equation of the regression line for the data in the scatter diagram is $y = 83.5 - 0.7x$

(b) Draw this line on the scatter diagram.

The male unemployment rates for these eight regions have a mean of 5.6%

(c) Use this information to find the mean of the male life expectancies for these regions.

....................................................... years

(1)

(d) Interpret the value of the gradient of this regression line.

..................................................................................................................................................................................................................................................
..................................................................................................................................................................................................................................................
..................................................................................................................................................................................................................................................
..................................................................................................................................................................................................................................................
..................................................................................................................................................................................................................................................

(2)

Rajesh now finds that the male unemployment rate for the missing ninth region is 8.0%

(e) Give two reasons why Rajesh should not use the regression line to predict the male life expectancy in this region.

(2)

(Total for Question 12 is 9 marks)
A film company employs Gary to investigate the film-watching habits of people living in the UK.

Gary is going to use a questionnaire.

Here is Question 1 on Gary’s questionnaire.

**Question 1**

Spin a fair coin.

If you get **Heads**, tick box A.
If you get **Tails**, answer this question.

**Have you downloaded a film illegally during the last month?**

If **yes**, tick box A. If **no**, tick box B.

A □ B □

The method used to decide whether or not to answer a question by spinning a coin is called the random response technique.

(a) Explain why this method is used.

..................................................................................................................................................................................................................................................
..................................................................................................................................................................................................................................................
..................................................................................................................................................................................................................................................
..................................................................................................................................................................................................................................................
..................................................................................................................................................................................................................................................
(1)

Gary sends the questionnaire to a sample of people living in a town.

He uses a telephone directory as the sample frame.

For Question 1

743 people ticked box A
679 people ticked box B

(b) Calculate an estimate of the proportion of the people in the sample who had downloaded a film illegally during the last month.

......................................................

(3)

Gary is going to write a report on the outcome of Question 1.

He is going to use the answer to part (b) as an estimate of the proportion of all the people living in the UK who had downloaded a film illegally during the last month.

(c) Is it appropriate for Gary to use the answer to part (b)?

Give **two** reasons for your answer.

..................................................................................................................................................................................................................................................
..................................................................................................................................................................................................................................................
..................................................................................................................................................................................................................................................
..................................................................................................................................................................................................................................................

(Source: blood.co.uk)

6 people attend a clinic on Monday to donate blood.

(a) (i) Name the probability distribution that can be used to model the number of people from these 6 people who will have blood group AB.

..................................................................................................................................................................................................................................................
..................................................................................................................................................................................................................................................
..................................................................................................................................................................................................................................................

(ii) Write down one condition needed so that this distribution is a suitable model.

..................................................................................................................................................................................................................................................
..................................................................................................................................................................................................................................................
..................................................................................................................................................................................................................................................
..................................................................................................................................................................................................................................................

(b) Work out the probability that exactly one of these 6 people will have blood group AB. Give your answer correct to 3 decimal places.

..................................................................................................................................................................................................................................................
..................................................................................................................................................................................................................................................
..................................................................................................................................................................................................................................................
..................................................................................................................................................................................................................................................
On Tuesday \( n \) people attend the clinic to donate blood.

The probability that at least one of these \( n \) people will have blood group AB is greater than 0.5

(c) What can you conclude, if anything, about the value of \( n \)?
You must show your working.

Higher Tier Formulae

You must not write on this page.

Anything you write on this page will gain NO credit.

Skew = \frac{3(\text{mean} - \text{median})}{\text{standard deviation}}

\text{Standard deviation} = \sqrt{\frac{1}{n} \sum (x - \bar{x})^2}

An alternative formula for standard deviation is

\text{standard deviation} = \sqrt{\frac{\sum x^2}{n} - \left(\frac{\sum x}{n}\right)^2}

Spearman’s rank correlation coefficient

r_s = 1 - \frac{6 \sum d^2}{n(n^2 - 1)}

Rates of change (e.g. Birth rate = \frac{\text{number of births} \times 1000}{\text{total population}} )

(a) Write down the public spending category in 2000 with the lowest public spending.

......................................................

(1)

(b) Describe the trend in the total public spending from 1995 to 2015

(Source: ukpublicspending.co.uk)

(a) Write down the public spending category in 2000 with the lowest public spending.

..................................................................................................................................................................................................................................................

(b) Describe the trend in the total public spending from 1995 to 2015

..................................................................................................................................................................................................................................................

The public spending column for 1995 adds up to 216.9 but the total is given as 216.7

(c) Give a possible reason why.

..............................................................................................................................................................................................................................................................................

(Total for Question 1 is 3 marks)
2 Archaeologists divided a field into 36 squares of equal size.

The number of Roman roof tiles found in each square was recorded.

The choropleth map below was drawn using this information.

<table>
<thead>
<tr>
<th></th>
<th>A</th>
<th>B</th>
<th>C</th>
<th>D</th>
<th>E</th>
<th>F</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td></td>
<td></td>

(Total for Question 2 is 2 marks)
3 Tomoyo found the weight, in grams, of each of 100 cherries.

(a) Circle the two words from the list that best describe the data Tomoyo found.

quantitative qualitative discrete continuous bivariate ordinal categorical

Tomoyo grouped the weights and she then drew this diagram for her results.

![Histogram of cherry weights]

The incomplete frequency table shows some information about her results.

<table>
<thead>
<tr>
<th>Weight (w grams)</th>
<th>Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>(1 \leq w &lt; 3)</td>
<td>10</td>
</tr>
<tr>
<td>(3 \leq w &lt; 5)</td>
<td></td>
</tr>
<tr>
<td>(5 \leq w &lt; 7)</td>
<td></td>
</tr>
<tr>
<td>(7 \leq w &lt; 9)</td>
<td></td>
</tr>
</tbody>
</table>

(b) (i) Complete the frequency column in the table.

(ii) Calculate an estimate of the mean weight of the 100 cherries.

....................................... g

(Total for Question 3 is 7 marks)
4  \( X \) and \( Y \) are two events.

The Venn diagram shows information about the probabilities of events related to \( X \) and \( Y \) happening.

\[
\begin{array}{c}
X \\
0.2 \quad 0.3 \quad 0.4 \\
Y \\
0.1
\end{array}
\]

(a) Find

(i) the probability of event \( Y \) happening.

(ii) \( P(X \text{ and } Y) \),

(iii) \( P(Y \mid X) \).

Two different events \( A \) and \( B \) are independent.

\( P(A) = 0.8 \) and \( P(B) = 0.5 \)

(b) Find \( P(A \text{ and } B) \).

(Total for Question 4 is 6 marks)
5 Gary is going to investigate the amounts of time students spend watching TV.

He is going to write a plan for this investigation.

His hypothesis is

“The amount of time that boys spend watching TV is greater than the amount of time that girls spend watching TV”.

Write down three other things he should include in his plan.

Explain why each of these things is appropriate.

You must refer to more than one stage of the statistical enquiry cycle.

..................................................................................................................................................................................................................................................

(Total for Question 5 is 6 marks)
6 Richard works in an animal rescue centre. He wants to compare the weights of the male cats and the weights of the female cats. The table shows information about the weights, in kg, of a sample of male cats and the weights, in kg, of a sample of female cats.

<table>
<thead>
<tr>
<th></th>
<th>Least</th>
<th>Lower quartile</th>
<th>Median</th>
<th>Upper quartile</th>
<th>Greatest</th>
</tr>
</thead>
<tbody>
<tr>
<td>Male</td>
<td>3.0</td>
<td>3.5</td>
<td>3.7</td>
<td>4.2</td>
<td>5.4</td>
</tr>
<tr>
<td>Female</td>
<td>3.0</td>
<td>3.2</td>
<td>3.3</td>
<td>3.8</td>
<td>4.6</td>
</tr>
</tbody>
</table>

(a) Use the information in the table to compare the distribution of the weights of male cats with the distribution of the weights of female cats. Interpret your comparisons.

The information for female cats is based on data collected from 47 cats at the centre.

(b) Work out the number of these female cats with a weight greater than or equal to 3.8 kg.

(Total for Question 6 is 4 marks)
7 Lata is investigating whether there are relationships between the test scores in different school subjects.

Lata has collected the test scores in English and the test scores in Maths for 15 students.

She decides to plot the data on a scatter diagram.

(a) Explain whether or not this is a good choice of diagram for her investigation. You should refer to the type of data in your answer.

Lata worked out Pearson’s product moment correlation coefficient for the English test scores and the Maths test scores for the 15 students.

She got a value of 0.65

Lata thinks that this means that if she improves her English test score then her Maths test score will improve.

(b) Is Lata right? Explain your answer.

Lata also collects the Science test scores for the 15 students.

Pearson’s product moment correlation coefficient for the Maths test scores and the Science test scores is 0.75

(c) Compare the two correlation coefficients 0.65 and 0.75 Interpret your answer in context.

(Total for Question 7 is 4 marks)
8 The cumulative percentage graph shows information about the ages of the people living in the UK in 2014

![Cumulative Percentage Graph](image)

(Source: ons.gov.uk)

(a) Find the 10th to 90th interpercentile range for this information.

....................................................... years

(2)

Here are some statistics about the ages of the people living in Manchester in 2014

<table>
<thead>
<tr>
<th>Median</th>
<th>29 years</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>10th to 90th interpercentile range</strong></td>
<td>53 years</td>
</tr>
</tbody>
</table>

(Source: ons.gov.uk)
(b) Compare the distribution of the ages of people living in Manchester in 2014 with that for the UK in 2014

The cumulative percentage graph shows information about the ages of the people living in the UK in 2014.

(a) Find the 10th to 90th interpercentile range for this information.

....................................................... years

(2)

Here are some statistics about the ages of the people living in Manchester in 2014:

- Median: 29 years
- 10th to 90th interpercentile range: 53 years

(Source: ons.gov.uk)

(c) (i) Calculate the skew for the ages of people living in Manchester in 2014

(ii) Interpret the skew in context.

The table below gives more information about the ages of people living in Manchester in 2014:

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Mean</strong></td>
<td>32 years</td>
</tr>
<tr>
<td><strong>Standard deviation</strong></td>
<td>19.3 years</td>
</tr>
</tbody>
</table>

(Source: ons.gov.uk)

(Total for Question 8 is 8 marks)
The table shows the results in two events of the women’s heptathlon for Jessica Ennis-Hill in the 2015 World Championships.

The mean and standard deviation for each of these two events for all the athletes who completed the heptathlon are also given.

<table>
<thead>
<tr>
<th></th>
<th>Jessica Ennis-Hill</th>
<th>Mean</th>
<th>Standard deviation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Long Jump (metres)</td>
<td>6.43</td>
<td>6.10</td>
<td>0.26</td>
</tr>
<tr>
<td>High Jump (metres)</td>
<td>1.86</td>
<td>1.79</td>
<td>0.066</td>
</tr>
</tbody>
</table>

(Source: iaaf.org)

(a) Use standardised scores for this information to compare Jessica Ennis-Hill’s performance in the Long Jump with her performance in the High Jump.

Explain how you reach your conclusion.
The table below shows Jessica Ennis-Hill’s result for the Javelin Throw.

It also shows information about the mean and the standard deviation for this event of all the athletes who completed the heptathlon.

<table>
<thead>
<tr>
<th>Jessica Ennis-Hill</th>
<th>Mean</th>
<th>Standard deviation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Javelin Throw (metres)</td>
<td>42.51</td>
<td>x</td>
</tr>
</tbody>
</table>

(Source: iaaf.org)

Jessica Ennis-Hill’s standardised score for the Javelin Throw was –0.32

(b) Work out the value of $x$. 

(2) 

(Total for Question 9 is 7 marks)
The comparative pie charts give information about the numbers of people living in two national parks. They also show the age groups of the people.

**The numbers of people living in two national parks**

(a) Compare the total number of people living in the Lake District with the total number of people living in Snowdonia.

Explain how you reach your conclusion.

..................................................................................................................................................................................................................................................................................................................
..................................................................................................................................................................................................................................................................................................................
..................................................................................................................................................................................................................................................................................................................
..................................................................................................................................................................................................................................................................................................................
..................................................................................................................................................................................................................................................................................................................

(2)
The comparative pie charts give information about the numbers of people living in two national parks. They also show the age groups of the people.

(a) Compare the total number of people living in the Lake District with the total number of people living in Snowdonia. Explain how you reach your conclusion.

..................................................................................................................................................................................................................................................................................................................................................................................................................................................................................................................
..................................................................................................................................................................................................................................................................................................................................................................................................................................................................................................................
..................................................................................................................................................................................................................................................................................................................................................................................................................................................................................................................

..................................................................................................................................................................................................................................................................................................................................................................................................................................................................................................................

(1)

Gill wants to draw a third comparative pie chart for Exmoor.

The number of people living in the Lake District is 3.9 times the number of people living in Exmoor.

The radius of the pie chart for the Lake District is 3 cm.

(d) Show that the radius of the pie chart for Exmoor is 1.52 cm, correct to 2 decimal places.

..................................................................................................................................................................................................................................................................................................................................................................................................................................................................................................................................................................................

(1)

(Total for Question 10 is 6 marks)
11 The box plots give information about the distributions of the ages of the trees in Acorn Wood and in Pine Wood.

(a) Justify, by calculation, that 70 is an outlier for Pine Wood.
Simon uses the information in the box plots to conclude that

“The average age of the trees in Acorn Wood is greater than the average age of the trees in Pine Wood.
Both distributions have the same spread.
Both distributions have a positive skew.”

(b) Comment on Simon’s conclusions with reference to his use of statistical words and the accuracy of his statements.
Give reasons for your answer.
12 Glowbright Garden Products produce bags of charcoal for use on barbecues.

For quality control, a sample of 5 bags of charcoal is taken at regular intervals and the mean weight of the bags in the sample calculated.

The sample means should be normally distributed with a mean of 4.1 kg and a standard deviation of 0.05 kg.

A quality control chart for the sample means is drawn.

Four sample means have been plotted.

(a) Complete the control chart by drawing the upper action line, the lower action line and the lower warning line.

Label your lines.

(b) The sample mean of sample 5 is 4.22 kg.

Determine any actions that need to be taken.

..................................................................................................................................................................................................................................................
..................................................................................................................................................................................................................................................
..................................................................................................................................................................................................................................................

..................................................................................................................................................................................................................................................
..................................................................................................................................................................................................................................................
..................................................................................................................................................................................................................................................

(c) David says that the standard deviation of the weights of bags of charcoal produced by Glowbright Garden Products should be 0.05 kg.

Is David correct?

..................................................................................................................................................................................................................................................
..................................................................................................................................................................................................................................................
..................................................................................................................................................................................................................................................
..................................................................................................................................................................................................................................................

(Total for Question 12 is 5 marks)
The sample mean of sample 5 is 4.22 kg.

(b) Determine any actions that need to be taken.

David says that the standard deviation of the weights of bags of charcoal produced by Glowbright Garden Products should be 0.05 kg.

(c) Is David correct?

(Total for Question 12 is 5 marks)
13 Peter thinks that the ages at inauguration of the presidents of the USA are normally distributed.

He collects information about the ages at inauguration, in years, of 43 presidents of the USA from the internet.

The grouped frequency table gives information about his results.

<table>
<thead>
<tr>
<th>Age at inauguration (x years)</th>
<th>Frequency (f)</th>
</tr>
</thead>
<tbody>
<tr>
<td>$42 \leq x &lt; 47$</td>
<td>4</td>
</tr>
<tr>
<td>$47 \leq x &lt; 52$</td>
<td>11</td>
</tr>
<tr>
<td>$52 \leq x &lt; 57$</td>
<td>13</td>
</tr>
<tr>
<td>$57 \leq x &lt; 62$</td>
<td>10</td>
</tr>
<tr>
<td>$62 \leq x &lt; 72$</td>
<td>5</td>
</tr>
</tbody>
</table>

(Source: robinsonlibrary.com)

(a) Write down one disadvantage of collecting information from the internet.

..................................................................................................................................................................................................................................................

(b) Peter uses a spreadsheet to calculate the following summary statistics for the information in the table.

$$\sum fx = 2361 \quad \sum fx^2 = 131\,334.5$$

where the values of $x$ are the class midpoints.

(b) Show that an estimate of the standard deviation of the ages at inauguration is 6.29

You may use Peter’s summary statistics.

..................................................................................................................................................................................................................................................

(c) Calculate an estimate for the proportion of these 43 presidents whose age at inauguration was within 1 standard deviation of the mean.

Give your answer correct to 2 significant figures.

..................................................................................................................................................................................................................................................

(d) Peter states that the age at inauguration of these presidents is normally distributed.

(d) Do you agree?

Use your answer to part (c) to justify your answer.

..................................................................................................................................................................................................................................................

..................................................................................................................................................................................................................................................

(Total for Question 13 is 9 marks)
Peter now draws this histogram to show the information in the grouped frequency table.

(c) Calculate an estimate for the proportion of these 43 presidents whose age at inauguration was within 1 standard deviation of the mean. Give your answer correct to 2 significant figures.

Peter states that the age at inauguration of these presidents is normally distributed.

(d) Do you agree?

Use your answer to part (c) to justify your answer.
14 $X$ and $Y$ are two events such that

$$P(X \text{ and } Y) = 0.2 \quad P(X \mid Y) = 0.4 \quad P(Y \mid X) = 0.5$$

Hiki says that

“$X$ and $Y$ are independent events”.

Do you agree?
Explain why.

(Total for Question 14 is 2 marks)
15 Jai is investigating the numbers of calls received by a helpline.

He recorded the number of calls received by the helpline on each day in May and on each day in June.

Jai wanted to compare the results by drawing histograms.
He drew the following diagrams.

Discuss whether these diagrams are appropriate in order to compare the results.
