INTERNATIONAL ADVANCED LEVEL

BIOLOGY

SAMPLE ASSESSMENT MATERIALS

Pearson Edexcel International Advanced Subsidiary in Biology (XBI11)
Pearson Edexcel International Advanced Level in Biology (YBI11)
First teaching September 2018
First examination from January 2019
First certification from August 2019 (International Advanced Subsidiary)
and August 2020 (International Advanced Level)
Edexcel, BTEC and LCCI qualifications

Edexcel, BTEC and LCCI qualifications are awarded by Pearson, the UK’s largest awarding body offering academic and vocational qualifications that are globally recognised and benchmarked. For further information, please visit our qualification website at qualifications.pearson.com. Alternatively, you can get in touch with us using the details on our contact us page at qualifications.pearson.com/contactus

About Pearson

Pearson is the world's leading learning company, with 35,000 employees in more than 70 countries working to help people of all ages to make measurable progress in their lives through learning. We put the learner at the centre of everything we do, because wherever learning flourishes, so do people. Find out more about how we can help you and your learners at qualifications.pearson.com

Introduction

The Pearson Edexcel International Advanced Subsidiary in Biology and the Pearson Edexcel International Advanced Level in Biology are part of a suite of International Advanced Level qualifications offered by Pearson.

These sample assessment materials have been developed to support these qualifications and will be used as the benchmark to develop the assessment students will take.
General marking guidance

- All candidates must receive the same treatment. Examiners must mark the last candidate in exactly the same way as they mark the first.
- Mark schemes should be applied positively. Candidates must be rewarded for what they have shown they can do rather than be penalised for omissions.
- Examiners should mark according to the mark scheme – not according to their perception of where the grade boundaries may lie.
- All the marks on the mark scheme are designed to be awarded. Examiners should always award full marks if deserved, i.e. if the answer matches the mark scheme. Examiners should also be prepared to award zero marks if the candidate’s response is not worthy of credit according to the mark scheme.
- Where some judgement is required, mark schemes will provide the principles by which marks will be awarded and exemplification/indicative content will not be exhaustive. However different examples of responses will be provided at standardisation.
- When examiners are in doubt regarding the application of the mark scheme to a candidate’s response, a senior examiner must be consulted before a mark is given.
- Crossed-out work should be marked unless the candidate has replaced it with an alternative response.

Using the Mark Scheme

Examiners should look for qualities to reward rather than faults to penalise. This does NOT mean giving credit for incorrect or inadequate answers, but it does mean allowing candidates to be rewarded for answers showing correct application of principles and knowledge. Examiners should therefore read carefully and consider every response: even if it is not what is expected it may be worthy of credit.

The mark scheme gives examiners:

- an idea of the types of response expected
- how individual marks are to be awarded
- the total mark for each question
- examples of responses that should NOT receive credit.

/ means that the responses are alternatives and either answer should receive full credit.
( ) means that a phrase/word is not essential for the award of the mark, but helps the examiner to get the sense of the expected answer.

Phrases/words in bold indicate that the meaning of the phrase or the actual word is essential to the answer.

ecf (error carried forward) means that a wrong answer given in an earlier part of a question is used correctly in answer to a later part of the same question.

Candidates must make their meaning clear to the examiner to gain the mark. Make sure that the answer makes sense. Do not give credit for correct words/phrases which are put together in a meaningless manner. Answers must be in the correct context.
Instructions

- Use **black** ink or **black** ball-point pen.
- **Fill in the boxes** at the top of this page with your name, centre number and candidate number.
- Answer **all** questions.
- Answer the questions in the spaces provided – **there may be more space than you need**.
- **Show all your working in calculations and include units where appropriate.**

Information

- The total mark for this paper is 80.
- The marks for **each** question are shown in brackets – **use this as a guide as to how much time to spend on each question**.
- In questions marked with an **asterisk** (*), marks will be awarded for your ability to structure your answer logically, showing how the points that you make are related or follow on from each other where appropriate.

Advice

- Read each question carefully before you start to answer it.
- Try to answer every question.
- Check your answers if you have time at the end.
Answer ALL questions.

Write your answers in the spaces provided.

Some questions must be answered with a cross in a box ☑. If you change your mind about an answer, put a line through the box ☒ and then mark your new answer with a cross ☑.

1 The cell membrane is important in the control of which substances can enter and leave the cell.

(a) The cell membrane consists of a phospholipid bilayer.

(i) Why do phospholipids form a bilayer?

☐ A the hydrophobic heads dissolve in the aqueous (water) environment
☐ B the hydrophobic heads move away from the aqueous (water) environment
☐ C the hydrophobic tails dissolve in the aqueous (water) environment
☐ D the hydrophobic tails move away from the aqueous (water) environment

(ii) This diagram shows part of a cell membrane.

Which letter represents a membrane glycoprotein?

☐ A P
☐ B Q
☐ C R
☐ D S
(b) State what is meant by the term **osmosis**.

(c) Compare and contrast exocytosis and endocytosis.

(d) Explain why oxygen molecules can pass directly through the cell membrane.

*(Total for Question 1 = 9 marks)*
2 The enzyme OMP decarboxylase is involved in the synthesis of the mononucleotide uridine monophosphate.

(a) The diagram shows the reaction catalysed by OMP decarboxylase.

(i) Which sugar is present in uridine monophosphate?

- A deoxyribose
- B galactose
- C glucose
- D ribose

(ii) Draw a circle around the base in uridine monophosphate.

(iii) Suggest one way in which cells use uridine monophosphate.
(b) The enzyme OMP decarboxylase increases the rate of carbon dioxide removal from orotidine monophosphate by $10^{17}$ times.

(i) State how OMP decarboxylase increases the rate of this reaction.

(ii) Explain why OMP decarboxylase catalyses this reaction only.

(Total for Question 2 = 8 marks)
3 Mammals have a heart that pumps blood through a network of blood vessels.

(a) The drawing shows a human heart.

(i) Which blood vessel takes blood from the heart to the body?

□ A
□ B
□ C
□ D

(ii) Which blood vessel has semilunar valves and contains blood with the highest concentration of carbon dioxide?

□ A
□ B
□ C
□ D
(b) The graph shows the change in volume of the left ventricle during the cardiac cycle.

![Graph showing the change in volume of the left ventricle during the cardiac cycle.](image)

(i) When is this heart in ventricular systole?

- A at 0.1 seconds
- B at 0.4 seconds
- C at 0.6 seconds
- D at 0.8 seconds

(ii) Calculate the volume of blood in dm$^3$ that will be pumped out of this heart by the left ventricle each minute.

Answer ______________________ dm$^3$
(c) As altitude (height above sea level) increases, the partial pressure of oxygen in the air decreases.

Llamas are mammals that are adapted to living at high altitudes.

The graph shows the oxygen dissociation curves for llama haemoglobin and human haemoglobin.

Explain the differences between the dissociation curves. Use the information in the graph to support your answer.

..........................................................................................................................
..........................................................................................................................
..........................................................................................................................
..........................................................................................................................
..........................................................................................................................
..........................................................................................................................
..........................................................................................................................
..........................................................................................................................
..........................................................................................................................

(Total for Question 3 = 10 marks)
Explain the differences between the dissociation curves. Use the information in the graph to support your answer.

(Total for Question 3 = 10 marks)
4 Lipids and carbohydrates can be used as energy storage molecules.

(a) Lactose is an important energy source in milk.

(i) What type of chemical reaction is involved in breaking a lactose molecule into two monosaccharides?

☐ A condensation
☐ B esterification
☐ C hydrogen bonding
☐ D hydrolysis

(ii) Milk contains 4.9 g of lactose per 100 g of milk.

Each gram of lactose provides 16 kJ of energy.

Calculate the energy available from the lactose in 200 g of milk.

Answer .................................................. kJ

(b) Carbohydrates used as energy storage molecules include glycogen and starch.

Compare and contrast the structures of glycogen and starch.
(c) (i) State one difference between the structure of a saturated lipid and an unsaturated lipid. (1)

(ii) Describe how a triglyceride is synthesised. (3)

(Total for Question 4 = 10 marks)
5 Red-green colour blindness is a common trait in humans.

(a) The gene for red-green colour blindness is located on the X chromosome.

State what is meant by the term **gene**.

(1)

(b) Describe how the two strands of DNA forming the double helix in a gene are held together.

(2)

(c) Explain why each codon for the DNA genetic code must contain at least three bases.

(3)
(d) A red-green colour blind father and an unaffected heterozygous mother had a child.

Determine the probability of this child being red-green colour blind.

Use a genetic diagram to support your answer.

Probability

(Total for Question 5 = 9 marks)
6. (a) Explain how human lungs are adapted for rapid gas exchange.

(b) Cystic fibrosis is an inherited condition which reduces gas exchange.

   The most frequently observed CFTR allele associated with cystic fibrosis carries the ΔF508 mutation.

   (i) State what is meant by the term allele.
(ii) The CFTR protein coded for by this mutation has one missing amino acid compared to the functioning protein.

Explain how this mutation results in a non-functioning CFTR protein.

(iii) Explain why people with cystic fibrosis may develop lung infections.
7 Collagen is an insoluble, fibrous protein.

(a) Describe the roles of RNA in the synthesis of collagen.

........................................................................................................................................
........................................................................................................................................
........................................................................................................................................
........................................................................................................................................
........................................................................................................................................
........................................................................................................................................
........................................................................................................................................
........................................................................................................................................
........................................................................................................................................
(b) Explain how the primary structure of collagen determines its properties. 

(Total for Question 7 = 9 marks)
Many studies have linked the development of atherosclerosis with cardiovascular disease (CVD).

(a) The photograph shows a section through an artery with a plaque (atheroma) from a patient with atherosclerosis.

[Image of artery with plaque]

Calculate the percentage increase in the thickness of the artery wall where the plaque is located.

Take your measurements along the line labelled X–Y.

Answer .............................................................. %
(b) Explain how atherosclerosis can result in damage to the heart muscle. 

..........................................................................................................................
..........................................................................................................................
..........................................................................................................................
..........................................................................................................................
..........................................................................................................................
..........................................................................................................................
..........................................................................................................................
..........................................................................................................................
..........................................................................................................................
(c) Cholesterol is transported in the blood as lipoproteins LDL and HDL.

In one study, the relationship between total blood cholesterol and the risk of death from CVD was investigated.

The results are shown in the graph.

In another study, the effect of the size of LDL and the ratio of total blood cholesterol to HDL on the relative risk of CVD was investigated.

The results are shown in the graph.
Assess the contribution of lipoproteins to the risk of developing CVD. Use the
information in the graph to support your answer.

(Total for Question 8 = 13 marks)

TOTAL FOR PAPER = 80 MARKS
1(a)(i) D

the hydrophobic tails move away from the aqueous (water) environment

(1)

1(a)(ii) B

(1)

1(b)

 diffusion of water molecules down a water potential gradient

through a partially permeable membrane

(1)

1(c) An answer that includes the following points:

similarities:

 both used to transport large particles/large quantities of material

(1)

 both involve (phospholipid) membrane vesicles

(1)

difference:

 exocytosis is export and endocytosis is import of material

Accept a description of both processes

(3)

1(d) An explanation that includes the following points:

 oxygen molecule is small

(1)

 oxygen molecule is non-polar

(1)

 (it can, therefore) pass between gaps {in cell membrane/hydrophobic tails}

(1)

(3)

8(c) | Answers will be credited according to candidate's deployment of knowledge and understanding of the material in relation to the qualities and skills outlined in the generic mark scheme. The indicative content below is not prescriptive and candidates are not required to include all the material indicated as relevant. Additional content included in the response must be scientific and relevant. **Indicative content**
- increased cholesterol increases chance of dying from CVD
- cholesterol concentrations are different in different countries
- same cholesterol level does not confer same risk in different countries
- greater the cholesterol to HDL ratio, the greater the risk of CVD
- the smaller the diameter the LDL, the greater the risk of CVD
- individuals at greatest risk of CVD are those with a large cholesterol to HDL ratio and small LDL diameter and a high cholesterol concentration
- not possible to say if different risks for a particular cholesterol concentration in the first study are due to differences in cholesterol to HDL ratio / diameter of LDL | Allow differences in the first study may be due to differences in cholesterol to HDL ratio / diameter of LDL | 6

</table>
Instructions

- Use black ink or black ball-point pen.
- Fill in the boxes at the top of this page with your name, centre number and candidate number.
- Answer all questions.
- Answer the questions in the spaces provided – there may be more space than you need.
- Show all your working in calculations and include units where appropriate.

Information

- The total mark for this paper is 80.
- The marks for each question are shown in brackets – use this as a guide as to how much time to spend on each question.
- In questions marked with an asterisk (*), marks will be awarded for your ability to structure your answer logically, showing how the points that you make are related or follow on from each other where appropriate.

Advice

- Read each question carefully before you start to answer it.
- Try to answer every question.
- Check your answers if you have time at the end.
Answer ALL questions.

Write your answers in the spaces provided.

Some questions must be answered with a cross in a box ✗. If you change your mind about an answer, put a line through the box ✗ and then mark your new answer with a cross ✗.

1 The phenotype of an organism is affected by a number of factors.

(a) State what is meant by the term **phenotype**.

.......................................................................................................................... ...
.......................................................................................................................... ...
.......................................................................................................................... ...

(b) Coat colour in rabbits is determined by multiple alleles.

The table gives some information about coat colour in rabbits.

<table>
<thead>
<tr>
<th>Type of rabbit</th>
<th>Coat colour of rabbit</th>
<th></th>

................................................................................................................................
(c) Explain why *Canthigaster valenti* and *Paraluteres prionurus* are unable to reproduce with each other.

(Total for Question 2 = 6 marks)
3 The photographs show yeast cells, seen using a light microscope and an electron microscope.

Yeast cells seen using a light microscope
Yeast cell seen using an electron microscope

Used under CC License from: https://commons.wikimedia.org/wiki/File:Zygosaccharomyces_bailii_cells.jpg

(a) Which structure identifies yeast as a eukaryotic organism?

☐ A  J
☐ B  K
☐ C  L
☐ D  M

(b) Explain why structure J can be seen using the electron microscope but not the light microscope.
(c) Explain why the nuclear envelope cannot be seen as two membranes using this electron microscope.

(d) Yeast cells reproduce asexually by a process called budding.

The parent yeast cell produces a bud.

(i) Explain the importance of mitosis in budding.
(ii) Once the bud is large enough, it separates from the parent yeast cell.

The rate at which budding happens depends on the availability of oxygen and nutrients.

Suggest why the availability of oxygen and nutrients determines the rate of budding.

4 The photograph shows a Baird's tapir.

![Baird's Tapir](https://www.biolib.cz/IMG/GAL/171566.jpg)

Source: https://www.biolib.cz/IMG/GAL/171566.jpg

(a) Baird's tapir is endemic to countries in Central America.

State what is meant by the term endemic.  

(1)

(b) Baird's tapir is classified as endangered.

In 2006, it was estimated that there were 5500 Baird's tapirs. This number had fallen to 3000 in 2016.

(i) Calculate the percentage decrease in the number of Baird's tapirs from 2006 to 2016.  

Answer .............................................................. %
(ii) Explain how human activity, other than hunting, could have caused this decrease in the number of Baird’s tapirs.

(c) Preservation of sperm collected from Baird’s tapir may help captive breeding programmes.

Scientists investigated the effect of freezing on sperm from Baird’s tapir.

The sperm were frozen and then thawed.

The results of this investigation are shown in the table.

<table>
<thead>
<tr>
<th>Sperm</th>
<th>Percentage of sperm capable of moving (%)</th>
<th>Ability of sperm to swim in a straight line / a.u.</th>
<th>Percentage of sperm with an undamaged acrosome (%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Freshly collected</td>
<td>63</td>
<td>3.5</td>
<td>80</td>
</tr>
<tr>
<td>Frozen and then thawed</td>
<td>38</td>
<td>2.5</td>
<td>48</td>
</tr>
</tbody>
</table>
(i) Describe how each of these effects of freezing could be determined.

(ii) Explain how freezing sperm could affect the success of captive breeding programmes.

(Total for Question 4 = 13 marks)
The photograph shows a pumpkin. 

The scientists Crafts and Lorenz investigated the rate of translocation through the phloem in pumpkins.

The flow chart shows the method used in this investigation.

**Step 1**
The mean increase in dry mass of a pumpkin after 792 hours of growth was estimated

**Step 2**
The cross-sectional area of the phloem tissue in the stalk was determined

**Step 3**
The cross-sectional area of the sieve tubes in the stalk was estimated

**Step 4**
The rate of translocation was calculated
(a) (i) Suggest how the mean increase in dry mass of a pumpkin could be estimated in Step 1.

(ii) Explain why Crafts and Lorenz used dry mass in this investigation.
(b) (i) The photograph shows a cross-section through part of a stalk, as seen using a light microscope.

Which letter is pointing to the phloem?

☐ A P
☐ B Q
☐ C R
☐ D S

(ii) Describe a method that could be used to determine the cross-sectional area of the phloem in Step 2.

(2)
(c) Give a reason why only the cross-sectional area of the sieve tubes, rather than the phloem tissue, was estimated in Step 3.

(1)

(d) What are the units for the rate of translocation calculated in Step 4?

☐ A  g cm\(^{-2}\) hr\(^{-1}\)

☐ B  g cm\(^{2}\) hr\(^{-1}\)

☐ C  g cm\(^{-3}\) hr\(^{-1}\)

☐ D  g cm\(^{3}\) hr\(^{-1}\)

(Total for Question 5 = 10 marks)
6 Organisms can be classified into one of three domains.

(a) Organisms belonging to two of these domains have prokaryotic cells.

(i) Bacteria are one of these domains.

Name the other domain that has prokaryotic cells.

(ii) The diagram shows the outline of a bacterial cell.

Draw three labelled features on this diagram that may be found in a prokaryotic cell.
(b) A variety of different types of bacteria is found in the human digestive system.

The diagram shows part of the human digestive system and the number and types of bacteria that can be found in each organ.

The table gives some information about conditions in the digestive system.

<table>
<thead>
<tr>
<th>Organ</th>
<th>pH</th>
<th>Oxygen content</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stomach</td>
<td>1 to 3</td>
<td>High</td>
</tr>
<tr>
<td>Duodenum</td>
<td>6 to 7</td>
<td>Low</td>
</tr>
<tr>
<td>Ileum</td>
<td>6 to 8</td>
<td></td>
</tr>
<tr>
<td>Colon</td>
<td>5 to 7</td>
<td></td>
</tr>
</tbody>
</table>
Explain the distribution of bacteria in the digestive system. Use the information in the diagram and table to support your answer.

(Total for Question 6 = 10 marks)
7 Red blood cells are produced from pluripotent stem cells found in bone marrow.

(a) Which statement about these stem cells is correct?

- A they can produce all types of cell
- B they can produce all types of cell except extraembryonic cells
- C they can produce some types of cell
- D they can produce red blood cells only

(b) Red blood cells contain haemoglobin.

A molecule of haemoglobin is made of four polypeptides. Each polypeptide has a haem group attached to it. The haem group is not made of amino acids.

In most adult haemoglobin, there are two α polypeptides and two β polypeptides.

The diagram shows the structure of adult haemoglobin.

Describe the role of the rough endoplasmic reticulum in the synthesis of haemoglobin.
(c) Fetal haemoglobin has a similar structure to adult haemoglobin. Fetal haemoglobin has two $\alpha$ polypeptides and two $\gamma$ polypeptides.

The graph shows the percentage of each polypeptide present in red blood cells in an individual before and after birth.

(i) Describe the changes in the percentages of polypeptides present in red blood cells. Use the information in the graph to support your answer.

(3)
(ii) Explain how epigenetic modification could result in these changes. (4)

(Total for Question 7 = 11 marks)
The biodiversity of four groups of organisms – birds, fish, mussels and aquatic plants – was studied along four sections of the Rideau River in Canada.

A biodiversity index value was calculated for each group of organisms.

The graph shows the results of this study.

The biodiversity index value can be used to compare biodiversity within one group of organisms.

The biodiversity categories (good, moderate and poor) can be used to compare biodiversity between different groups of organisms.

(a) Which statement describes biodiversity?

- A species richness of only the endemic species within a habitat
- B species richness of all the species within a habitat
- C the role of only the endemic species within a habitat
- D the role of all the species within a habitat
*(b) Describe the changes in biodiversity along the Rideau River. Use the information in the graph to support your answer.*
(c) In Section 1, birds have a biodiversity index value of 1.6 and fish have a biodiversity index value of 2.5.

Suggest why the fish are considered to have a moderate biodiversity and the birds have a good biodiversity, but the biodiversity index value of the fish is greater.

(2)

(d) No data were available for aquatic plants in Section 3.

A student collected some data in Section 3 to calculate a biodiversity index value. The equation that the student used is:

$$\sum = \frac{N(N-1)}{n(n-1)}$$

The data are shown in a table prepared by the student.

<table>
<thead>
<tr>
<th>Species of aquatic plant</th>
<th>Number of aquatic plants counted (n – 1)</th>
<th>n(n – 1)</th>

Answers will be credited according to candidate’s deployment of knowledge and understanding of the material in relation to the qualities and skills outlined in the generic mark scheme.

The indicative content below is not prescriptive and candidates are not required to include all the material indicated as relevant. Additional content included in the response must be scientific and relevant.

**Indicative content**

- numbers of bacteria increase along the digestive system
- *Veillonella* can tolerate only low pHs
- *Streptococcus* found in pH 6 - 8 with reasonably high oxygen content
- *Streptococcus* requires oxygen for aerobic respiration
- *Enterobacterium* can tolerate low oxygen concentrations
- *Enterobacterium* requires less ATP or can respire anaerobically
- pH affects enzyme activity
- pH affects the ionisation of R groups
- small change in pH drastically affects enzyme activity

### Question number 8(d)(ii)

- $\sum n(n-1)$ is 228 (1)
- value for $N(N-1)$ is $(11 \times 10) = 110$ (1)
- diversity index is 0.48 (1)
Question number
Answer
Mark

8 (c)
An answer that includes the following points:

 there are more species of fish than birds (1)
 therefore a value of 2.5 has a relatively lower biodiversity than a value of 1.6 (1)

8 (d)(i)
Species of aquatic plant
Number of aquatic plants counted

Coontail 8 7 56
Tape grass 6 5 30
Common waterweed 3 2 6
Northern water milfoil 2 1 2
Star duckweed 9 8 72
White water lily 2 1 2
Water stargrass 2 1 2
Eurasian watermilfoil 6 5 30
Curly pondweed 5 4 20
European frogbit 2 1 2
Flowering rush 3 2 6

(1)

8 (d)(ii)
 \( \sum n(n-1) \) is 228 (1)
 value for \( N(N-1) \) is \( (11 \times 10) = 110 \) (1)
 diversity index is 0.48 (1)
1 A student made observations of plant cells and tissues through a microscope.

(a) (i) Photograph A shows part of a transverse section of a stem at a magnification of ×40.

Photograph A

Draw a low-power plan of the area within the triangle shown on Photograph A and label two tissues on your drawing.
(ii) Photograph B shows part of a transverse section of the same stem at a magnification of ×400.

![Photograph B](image)

Source: John Adds

Photograph B

Draw the cells within the box shown on Photograph B. (3)
(b) The diagram shows part of a stage micrometer scale and part of a graticule scale.

The smallest stage micrometer division is $10 \mu m$.

(i) Calculate the size of one small division of the graticule scale.

\[ \text{Answer} \quad \text{\( \mu m \)} \]

(ii) Using your answer to (b)(i), determine the internal diameter of the part labelled 'A'.

\[ \text{Answer} \quad \text{\( \mu m \)} \]

(Total for Question 1 = 10 marks)
(ii) Using your answer to (b)(i), determine the internal diameter of the part labelled ‘A’.

Answer...............................................

μm

(Total for Question 1 = 10 marks)
2 Mercerisation is a treatment used to increase the tensile strength of natural plant fibres. In this process, fibres are treated with sodium hydroxide solution.

A study was carried out to determine the concentration of sodium hydroxide solution to produce the strongest fibres.

Samples of fibres were obtained from four Nigerian plants: baobab, roselle, okra and kenaf.

All of these fibres were then mercerised by placing them in four different concentrations of sodium hydroxide solution.

The tensile strength of these fibres was then measured.

(a) (i) State the independent variable in this investigation. (1)

(ii) State how one named variable could be controlled when mercerising the fibres. (2)

Variable 

How the variable could be controlled 

(iii) Devise a method that can be used to make a valid comparison of the tensile strength of fibres from the same plant, treated with different concentrations of sodium hydroxide solution.
(iii) Devise a method that can be used to make a valid comparison of the tensile strength of fibres from the same plant, treated with different concentrations of sodium hydroxide solution.

(5)
(b) The graph shows the tensile strength of fibres from these four plants, treated with sodium hydroxide solutions.

(i) Using the graph, determine the concentration of sodium hydroxide solution that should be used for mercerisation of fibres from each of these four plants.

(ii) Draw a suitable table to include the results for roselle and baobab only.

(2)
(ii) Draw a suitable table to include the results for roselle and baobab only.
(c) Mercerisation causes plant fibres to swell.

A study was carried out on the effect of temperature and the concentration of sodium hydroxide on the degree of swelling of cotton fibres.

The graph shows the results of this study.

(i) Compare and contrast the trends shown by the results at 20 °C with those at 0 °C.

..................................................................................................................................
..................................................................................................................................
..................................................................................................................................
..................................................................................................................................
..................................................................................................................................

(ii) Describe the effect of temperature on the degree of swelling of cotton fibres at a sodium hydroxide concentration of 5%.

..................................................................................................................................
..................................................................................................................................
..................................................................................................................................
..................................................................................................................................
..................................................................................................................................

(Total for Question 2 = 17 marks)
(ii) Describe the effect of temperature on the degree of swelling of cotton fibres at a sodium hydroxide concentration of 5%.

(2)

(Total for Question 2 = 17 marks)
3 A student studied the water potential of carrot tissue.

Pieces of weighed carrot tissue were placed in a range of sucrose solutions.

After two hours, the tissue was blotted and weighed again. The results are shown in the table.

<table>
<thead>
<tr>

(a) (i) Calculate the percentage change in mass when the carrot tissue was in a sucrose solution of 1.0 mol dm\(^{-3}\).

(ii) Plot a suitable graph to show the relationship between sucrose concentration and percentage change in mass. Join the points with straight lines.
(iii) Using your graph, determine the concentration of sucrose solution which caused no change in mass of the carrot tissue. 

(2)

(iv) Explain why there is no change in mass of the carrot at this concentration. 

(2)

(b) Five students investigated the effect of temperature on the movement of materials through the membranes of cells in a plant tissue. Beetroot was chosen for this investigation because the cells contain a red pigment called betalain. 

One piece of beetroot was placed into a tube containing 15 cm³ of water at 0 °C and left for 15 minutes. The procedure was repeated for seven further temperatures between 10 °C and 70 °C. 

Each piece of beetroot was removed and a sample of the fluid was placed in a colorimeter. The colorimeter was used to determine the intensity of the red colour of the fluid. 

(i) Name **two** variables, other than those mentioned above, which should be kept constant during this experiment. 

(2)
(ii) State the dependent variable in this investigation. 

(iii) The table shows the results of this investigation.

</thead>
</table>
| 3(b)(v)         | An answer that includes any five of the following points:  
• (overall) the intensity of the red colour increases as temperature increases (1)  
• but from 0°C to 40°C, the SDs overlap so no significant effect (1)  
• at 50°C the mean is higher than that at 40°C but SDs overlap so there is no case for saying the difference is significant (1)  
• at 60°C the mean is higher than that at 50°C and the SDs do not overlap so this difference can be regarded as significant (1)  
• at 70°C the mean degree of redness falls from that at 60°C but the SDs overlap so temperatures above 60°C appear to have no further effect (1)  
• there are no data above 70°C so cannot say what any further rise in temperature would cause (1) | (5) |
Mark 3(b)(v)

An answer that includes any five of the following points:

- Overall, the intensity of the red colour increases as temperature increases (1)
- But from 0°C to 40°C, the SDs overlap so no significant effect (1)
- At 50°C the mean is higher than that at 40°C but SDs overlap so there is no case for saying the difference is significant (1)
- At 60°C the mean is higher than that at 50°C and the SDs do not overlap so this difference can be regarded as significant (1)
- At 70°C the mean degree of redness falls from that at 60°C but the SDs overlap so temperatures above 60°C appear to have no further effect (1)
- There are no data above 70°C so cannot say what any further rise in temperature would cause (1)
Answer ALL questions.

Write your answers in the spaces provided.

Some questions must be answered with a cross in a box ✗. If you change your mind about an answer, put a line through the box ☒ and then mark your new answer with a cross ✗.

1  (a) The diagram shows the structure of an Ebola virus.

(i) Which of the following viruses contain the same type of nucleic acid as the Ebola virus?

☐ A  human immunodeficiency virus (HIV) only
☐ B  human immunodeficiency virus (HIV) and tobacco mosaic virus (TMV)
☐ C  lambda phage (λ. phage) only
☐ D  lambda phage (λ. phage) and tobacco mosaic virus (TMV)

(ii) Which of the following viruses have a helical capsid?

☐ A  human immunodeficiency virus (HIV) and lambda phage (λ. phage)
☐ B  human immunodeficiency virus (HIV) only
☐ C  lambda phage (λ. phage) and tobacco mosaic virus (TMV)
☐ D  tobacco mosaic virus (TMV) only

Turn over
(iii) What type of molecule makes up the capsid of a virus?  

☐ A  carbohydrate  
☐ B  lipid  
☐ C  nucleic acid  
☐ D  protein  

(iv) The volume of an Ebola virus is approximately $7.76 \times 10^4 \text{ nm}^3$.  

Tobacco mosaic virus (TMV) is approximately 300 nm long and 80 nm in diameter.  

Calculate how many times larger Ebola virus is than TMV.  

Assume that TMV is a cylinder in shape.  

The volume of a cylinder is calculated using the formula  

$$V = \pi r^2 l$$  

Answer ..............................................
(b) Human immunodeficiency virus (HIV) contains two enzymes that are not found in most other types of virus.

(i) Name these two enzymes. (1)

Antibodies play an important role in the immune response.

(a) Explain the importance of antibodies.

(b) There are different classes of antibody, including IgA, IgG and IgM.

The graph shows the changes in the concentration of IgA and IgG in the plasma of a fetus before birth and in a child after birth.

Key

---
IgG produced by the mother

---
IgG produced by the child

---
IgA produced by the mother
(i) Describe the changes in the classes of antibody in a fetus before birth and in a child after birth. Use the information in the graph to support your answer.

(ii) Which type of immunity explains the presence of IgA?

- A artificial active
- B artificial passive
- C natural active
- D natural passive
(iii) Suggest why the concentration of antibodies is less in a child 12 months after birth than in an adult.

(2)

(Total for Question 2 = 10 marks)
(iii) Suggest why the concentration of antibodies is less in a child 12 months after birth than in an adult.

(Total for Question 2 = 10 marks)
3 (a) Explain the role of the products of the light-dependent reactions of photosynthesis in the Calvin cycle.

(b) The graph shows the net carbon fixation in a plant over a period of 24 hours.
(i) Calculate the rate of decrease of net carbon fixation at 12:00 hours.
Include units in your answer.

(ii) Suggest an explanation for the decrease in net carbon fixation between 12:00 hours and 13:00 hours.
(iii) Suggest why the net carbon fixation was negative before 0500 hours and after 1900 hours.

(Total for Question 3 = 12 marks)
4 Anthropogenic climate change is considered to be a result of greenhouse gas emissions.

(a) State what is meant by the term **anthropogenic climate change**. (2)

(b) (i) Name **two** greenhouse gases. (1)

(ii) Explain the role of greenhouse gases in climate change. (2)
*(c) The pie chart shows the relative contribution of different sources of greenhouse gas emissions.

- Energy supply: 25.9%
- Homes and business buildings: 7.9%
- Transport: 13.1%
- Industry: 19.4%
- Agriculture: 13.5%
- Forestry: 17.4%
- Waste and wastewater: 2.8%
- Buildings: 7.9%
- Energy supply: 25.9%

Explain the relative contribution of each source of greenhouse gas. Use the information in the pie chart and your own knowledge to support your answer.
Explain the relative contribution of each source of greenhouse gas. Use the information in the pie chart and your own knowledge to support your answer. 

(Total for Question 4 = 11 marks)
Some disorders are caused by mutations in the mitochondrial DNA and can be inherited. Three-parent embryos have been developed to prevent the inheritance of these disorders. Diagram 1 shows how three-parent embryos are made.

Diagram 1

(a) The cells in the three-parent embryo are totipotent stem cells. State what is meant by the term totipotent stem cells.

..........................................................................................................................
..........................................................................................................................
..........................................................................................................................
..........................................................................................................................
..........................................................................................................................
Some disorders are caused by mutations in the mitochondrial DNA and can be inherited.

Three-parent embryos have been developed to prevent the inheritance of these disorders.

Diagram 1 shows how three-parent embryos are made.

Diagram 1

(a) The cells in the three-parent embryo are totipotent stem cells.

State what is meant by the term totipotent stem cells.

(2)
(b) Diagram 2 shows the results of separating the DNA from the three-parent embryo, the mother and the father, using gel electrophoresis.

The bands from the DNA of the embryo are labelled from 1 to 12.

(i) Which of the following is the reason for the movement of the DNA fragments?

- A negatively-charged fragments move towards the negative end of the gel
- B negatively-charged fragments move towards the positive end of the gel
- C positively-charged fragments move towards the negative end of the gel
- D positively-charged fragments move towards the positive end of the gel
(ii) Which band on the gel contains the heaviest DNA fragments? (1)

- A 1
- B 3
- C 6
- D 9

*(iii) Explain the banding pattern of this three-parent embryo. Use information in Diagram 1 and Diagram 2 to support your answer. (6)*

(Total for Question 5 = 10 marks)
6 Tuberculosis is a disease caused by infection with *Mycobacterium tuberculosis*.

The cell wall of *M. tuberculosis* is different from most other types of bacteria as it contains different types of mycolic acid.

Mycolic acid protects the bacteria from lysozyme action, dehydration and polar (hydrophilic) antibiotics.

The diagram shows part of one type of mycolic acid.

![Diagram of mycolic acid]

(a) What type of molecule is mycolic acid?

☐ A carbohydrate

☐ B fatty acid

☐ C nucleic acid

☐ D polypeptide
(b) Treatment for tuberculosis involves the use of different types of antibiotic, taken over several months.

The table gives details of four antibiotics used to treat tuberculosis.

<table>
<thead>
<tr>
<th>Antibiotic</th>
<th>Mode of action</th>
</tr>
</thead>
<tbody>
<tr>
<td>E</td>
<td>disrupts the formation of the cell wall</td>
</tr>
<tr>
<td>J</td>
<td>inhibits the synthesis of mycolic acids</td>
</tr>
<tr>
<td>P</td>
<td>activates an enzyme that inhibits the synthesis of fatty acids</td>
</tr>
<tr>
<td>R</td>
<td>binds to the active site of RNA polymerase</td>
</tr>
</tbody>
</table>

(i) Suggest why antibiotic E is effective only when *M. tuberculosis* bacteria are dividing.

...................................................................................................................................................
...................................................................................................................................................
...................................................................................................................................................
...................................................................................................................................................

(ii) Explain why antibiotic J could result in an increase in antigen presentation by macrophages.

...................................................................................................................................................
...................................................................................................................................................
...................................................................................................................................................
...................................................................................................................................................
...................................................................................................................................................
...................................................................................................................................................
(iii) Explain how antibiotic P could affect $M. tuberculosis$.

(iv) Explain how antibiotic R could affect $M. tuberculosis$.
(v) Explain why taking a combination of antibiotics for several months could increase the resistance of *M. tuberculosis* to these antibiotics.

(Total for Question 6 = 12 marks)
7 Temperature affects the rate of growth of bacteria.

The diagram shows some information about the growth of bacteria in different ranges of temperature.

(a) Explain why most types of bacteria are killed at temperatures above 60 °C, but bacteria can grow slowly in a temperature range of 50 °C to 60 °C.

(b) (i) The growth rate constant will be at its highest in the temperature range of 5 °C to 50 °C.

Calculate the growth rate constant \( (k) \) of bacteria that have increased from \( 5 \times 10^3 \) cells per cm\(^3\) to \( 1.3 \times 10^5 \) cells per cm\(^3\) in 4 hours.

\[ k = \log_{10} \left( \frac{1.3 \times 10^5}{5 \times 10^3} \right) \times \frac{1}{4} \]

Answer...............................................

(ii) The formula used to calculate the growth rate constant can only be applied to one phase of bacterial growth.

To which phase of bacterial growth can the formula be applied?

A death  
B exponential  
C lag  
D stationary
(b) (i) The growth rate constant will be at its highest in the temperature range of 5°C to 50°C.

Calculate the growth rate constant \( (k) \) of bacteria that have increased from \( 5 \times 10^3 \) cells per cm\(^3\) to \( 1.3 \times 10^5 \) cells per cm\(^3\) in 4 hours.

\[
k = \frac{\log_{10} N_f - \log_{10} N_0}{0.301 \times t}
\]

(ii) The formula used to calculate the growth rate constant can only be applied to one phase of bacterial growth.

To which phase of bacterial growth can the formula be applied?

- A death
- B exponential
- C lag
- D stationary

Answer: ...............................................

(3)
(c) (i) Explain why some foods are kept in refrigerators at a temperature between 0°C and 5°C.

(Total for Question 7 = 13 marks)
8 The photograph shows a wood frog.

Source: http://www.borealforest.org/reptiles/wood_frog.htm

Wood frogs are found throughout North America.

The shaded areas on the map shows the distribution of wood frogs in North America.

Information is also given about the climate in two areas, Alaska and Ohio.

Alaska
Range of temperatures in January: −28 °C to −19 °C
Annual snow fall: 174 cm

Ohio
Range of temperatures in January: −5 °C to 4 °C
Annual snow fall: 35 cm

(a) Scientists kept a wood frog from Alaska at −16°C. The scientists measured the concentration of glycogen in the liver and the concentration of glucose in the plasma over a period of 48 hours.

The graph shows the results.

![Graph showing concentration of glycogen in liver and glucose in plasma over time.]

(i) How many of the following statements describe glycogen?

1. The monomer is β glucose
2. It is made from two different types of polymer
3. There are 1,4 and 1,6 glycosidic bonds
4. It is insoluble

☐ A 1  
☐ B 2  
☐ C 3  
☐ D 4

(ii) Explain the changes in the concentration of glycogen and glucose. Use the information in the graph to support your answer.

(b) The scientists found that wood frogs from Alaska had higher concentrations of glucose in their plasma than wood frogs from Ohio.

The scientists also found that the wood frogs from Alaska had higher concentrations of other solutes, such as urea, in their plasma.

The table shows the mean concentration of urea in the plasma of these frogs. The table also shows the standard deviations.

<table>
<thead>
<tr>
<th>Type of wood frogs</th>
<th>Mean concentration of urea in plasma / µmol cm⁻³</th>
<th>Standard deviation</th>
</tr>
</thead>
<tbody>
<tr>
<td>from Alaska</td>
<td>106</td>
<td>10</td>
</tr>
<tr>
<td>from Ohio</td>
<td>28</td>
<td>5</td>
</tr>
</tbody>
</table>

(i) Calculate the percentage difference in the mean concentration of urea in the plasma of the wood frogs from Alaska compared with the wood frogs from Ohio.

Answer \[ \% \]
(ii) Explain why the data for the wood frogs from Alaska are more reliable than the data for the wood frogs from Ohio.

(iii) Explain why a high concentration of solutes in the plasma could protect the wood frogs from Alaska in very cold temperatures.
(c) Explain how these wood frogs evolved to occupy different niches in North America.

(Total for Question 8 = 13 marks)

TOTAL FOR PAPER = 90 MARKS

Unit 4 - Mark scheme

Question number Answer Mark

1(a)(i) B human immunodeficiency virus (HIV) and tobacco mosaic virus (TMV) (1)

1(a)(ii) D protein (1)

1(b)(i)  reverse transcriptase and integrase (1)

1(b)(ii) An explanation that includes the following points:
   because these enzymes are not present in the host cell (1)
   because reverse transcriptase is needed to make a DNA copy of the viral RNA (1)
   because integrase is needed to incorporate the DNA copy into the host cell genome (1) (3)

Example of calculation:

3.14 × 40 × 40 × 300 = 1,507,200

19 / 19.4 / 19.4²

Allow correct answer with no working shown gains full marks (2)

Additional guidance:

1(a)(iv)

• calculation of volume of TMV (1)
• calculation of size difference (1)

Example of calculation:

3.14 × 40 × 40 × 300 = 1,507,200

19 / 19.4 / 19.4²

| 4(b)(i)         | Any two from:  
  - carbon dioxide  
  - methane  
  - water vapour  
  - nitrogen oxides  
  - CFCs | Accept correct chemical formulae | (1) |
| 4(b)(ii)        | An explanation that includes the following points:  
  - accumulated gases in the atmosphere trap infrared radiation (1)  
  - resulting in an increase in the temperature of the Earth's {atmosphere / surface} (1) | | (2) |
| 4(c)            | Answers will be credited according to candidate's deployment of knowledge and understanding of the material in relation to the qualities and skills outlined in the generic mark scheme.  
  The indicative content below is not prescriptive and candidates are not required to include all the material indicated as relevant. Additional content included in the response must be scientific and relevant.  
  **Indicative content**  
  - carbon dioxide is released into atmosphere  
  - because agriculture requires farm machinery powered by burning fossil fuels  
  - because industry burns fossil fuels for energy  
  - because homes and business buildings use fossil fuels for heating  
  - transport uses fossil fuels  
  - fossil fuels are burnt to produce electricity  
  - forestry may decrease the number of trees  
  - so less carbon dioxide removed from air by photosynthesis | | (6) |
Any two from:

- carbon dioxide
- methane
- water vapour
- nitrogen oxides
- CFCs

Accept correct chemical formulae.
5(b)(iii) Answers will be credited according to candidate’s deployment of knowledge and understanding of the material in relation to the qualities and skills outlined in the generic mark scheme.

The indicative content below is not prescriptive and candidates are not required to include all the material indicated as relevant. Additional content included in the response must be scientific and relevant.

**Indicative content**

- Bands 1, 2, 5, 9 and 11 in the embryo are also found in the mother
- therefore, they must have been present in the nucleus of the egg cell from the mother
- Bands 4, 6, 7, 8 and 10 in the embryo are also found in the father
- therefore they must have been present in the nucleus of the sperm from the father
- Bands 3 and 12 in the embryo are not found in either the mother or the father
- therefore they must have been the mitochondrial DNA from the donor
- both mother and father have bands not found in the embryo
- the bands in the mother could be her mitochondrial DNA

**Question number** | **Answer** | **Mark**
--- | --- | ---
7(a) | An explanation that includes the following points:  
- above 60 °C the enzymes are denatured (1)  
- so there will be no metabolic reactions (1)  
- because between 50 °C to 60 °C the enzymes are working slowly (1)  
- because the enzymes are denaturing (1) | (4)

**Question number** | **Answer** | **Additional guidance** | **Mark**
--- | --- | --- | ---
7(b)(i) | \( \log_{10} \) of 5 \( \times \) 10\(^3\) and 1.3 \( \times \) 10\(^5\) stated (1)  
- denominator calculated (1)  
- answer (1)  
Example of calculation:  
3.7 and 5.1  
0.301 \( \times \) 4 = 1.204  
\( \frac{1}{1.2} / \frac{1}{1.16} \) | Allow ecf  
Award full marks for correct numerical answer without working | (3)

7(b)(ii) | B exponential | (1)

7(c)(i) | An explanation that includes the following points:  
- decomposition will be slower (1)  
- because the enzymes will be less active (1)  
- as there is less [heat / kinetic] energy (1) | (3)

7(c)(ii) | An explanation that includes the following points:  
- cytoplasm will be frozen (1)  
- therefore enzymes and substrates will not be able to {move / collide} (1) | (2)

Instructions

- Use black ink or black ball-point pen.
- Fill in the boxes at the top of this page with your name, centre number and candidate number.
- Answer all questions.
- Answer the questions in the spaces provided – there may be more space than you need.
- Show all your working in calculations and include units where appropriate.

Information

- The total mark for this paper is 90.
- The marks for each question are shown in brackets – use this as a guide as to how much time to spend on each question.
- In questions marked with an asterisk (*), marks will be awarded for your ability to structure your answer logically, showing how the points that you make are related or follow on from each other where appropriate.

Advice

- Read each question carefully before you start to answer it.
- Try to answer every question.
- Check your answers if you have time at the end.
Answer ALL questions.

Write your answers in the spaces provided.

Some questions must be answered with a cross in a box ☒. If you change your mind about an answer, put a line through the box ☒ and then mark your new answer with a cross ☒.

1 The diagram shows the sequence of electron carriers in the electron transport chain. The diagram also shows the stages where ATP is generated.

- reduced NAD → NADH dehydrogenase → ATP
- reduced FAD → coenzyme Q → cytochrome b → ATP
- cytochrome c₁ → cytochrome c → cytochrome (a + a₃) → oxygen

(a) Where is the site of the electron transport chain?

☐ A cytoplasm
☐ B inner mitochondrial membrane
☐ C matrix
☐ D outer mitochondrial membrane

(1)

(ii) Metabolism of succinate results in the production of reduced FAD.

- succinate → fumarate → reduced FAD

(b) The table gives some information about inhibitors of the electron transport chain.

<table>
<thead>
<tr>

(b) The ripening of apples is an example of positive feedback.

Ethene is a gas that causes apples to ripen. Ripe apples release ethene.

Complete the diagram to show positive feedback in the ripening of apples.

(Total for Question 2 = 8 marks)
3 A number of insects can transmit disease when they bite their hosts.

The photograph shows *Rhodnius prolixus*, a blood-sucking insect that transmits Chagas disease between humans.

This insect feeds on blood by extending its proboscis and pushing it through the skin of a person. It is thought to do this when it detects body warmth.

An investigation was carried out to study the effect of a heat stimulus on the proboscis extension response (PER).

Insects were kept in a temperature-controlled container with a heat pad placed in front of them. The heat pad could be touched by the proboscis when fully extended.

The heat pad was initially set at 25 °C. It was then heated up to 35 °C and the number of insects with a fully-extended proboscis were counted. It was then returned to a temperature of 25 °C.

This procedure was repeated a number of times.
The graph shows the results of this investigation.

(a) In this investigation, 350 insects were used.

Calculate the mean decrease in the number of insects showing PER each time the procedure was repeated.

Answer ..............................................................
(b) Explain the results of this investigation. (3)

(c) Suggest why a drop in PER to a heat stimulus could be an advantage to these insects. (2)

Some groups of living organisms produce neurotoxins. Neurotoxins act at synapses, preventing the generation of nerve impulses.

Some scientists have been studying neurotoxins using a combination of computer science, statistics and mathematics.

(a) What is the name of a study that combines computer science, statistics and mathematics?

- A  bioinformatics
- B  computed tomography
- C  epigenetics
- D  forensic entomology

(b) Some neurotoxins act in these ways:
- inhibiting the release of acetylcholine
- blocking of ion channels
- blocking of acetylcholine receptors.

Explain how these neurotoxins prevent the generation of nerve impulses.
(c) The table shows the mean composition of three amino acids, in neurotoxins and non-toxins.

<table>

Introduction

1. Spaceflight-induced muscle atrophy poses a significant risk for astronaut health and mission performance. Accordingly, it is a major obstacle for manned deep-space exploration. In contrast to observations on the Earth, exercise countermeasures employed during spaceflight have proven ineffective for maintaining skeletal muscle mass. Although the optimal exercise and nutritional strategies might simply have not yet been developed, there is growing evidence that muscle may be intrinsically sensitive to the effects of spaceflight per se. For example, vascular and cardiac muscles undergo atrophy, without reported muscle unloading, and cultured embryonic muscle synthesizes less protein as a direct consequence of spaceflight. However, the molecular events regulating these changes remain unclear.

2. Here we aimed to identify the mechanisms that are triggered in response to microgravity using the nematode *Caenorhabditis elegans*. In this space experiment (CERISE; *C. elegans* RNA Interference in Space Experiment), we synchronously cultured L1 larvae-stage animals to adulthood in liquid media for 4 days either in microgravity or 1-G (gravitational acceleration unit) centrifuge conditions onboard the Japanese Experiment Module of the International Space Station (ISS). The nematode larvae were launched to the ISS onboard the Space Shuttle Atlantis STS-129 on 16 November 2009, cultures were initiated on 20 November 2009, and the post-cultivation frozen samples were returned by the Space Shuttle Endeavour STS-130 on 21 February 2010.

3. *C. elegans* is an ideal model organism for studies of the physiological effects of space environments because of its small size, short life cycle, and because of its common use on Earth as a model organism for human medical pathologies. The first examinations of the effects of the space environment, including cosmic radiation, on *C. elegans* were performed using essentially standard laboratory culturing techniques with agar plates. *C. elegans* can mate, reproduce, and undergo embryonic development during spaceflight, and radiation-induced mutations can be monitored during spaceflight experiments. During the Dutch Soyuz mission DELTA to the ISS in April 2004, an international collaboration of laboratories carried out the “the first International *C. elegans* Experiment in Space” (ICE-First). In the ICE-First experiment, we found that muscle-, metabolic-, and aging-related genes showed 10–20% lower expression levels in response to spaceflight. These studies were carried out in a chemically defined medium, which allowed study of the effects of surface tension in flight but which significantly alters *C. elegans* life history in a manor akin to dietary restriction.
4. In this study, we wished to confirm that gene and protein expression changes observed in ICE-FIRST were not unique to the operational issues associated with that spaceflight, were not owing to the use of a non-standard laboratory diet, and were not owing to exposure to microgravity. To achieve these goals we flew worms on a different launch system, cultured them in a different segment of the ISS, froze them on orbit, used the standard nutritionally rich bacterial diet, and cultured them both in microgravity and on a 1-G centrifuge onboard the ISS. In our previous study ICE-First, worms exposed to microgravity showed ~20% lower expression of thick filament components such as myosin heavy chain and paramyosin upon return to Earth. In the current study CERISE, changes in the expression of these same genes were found in the worms grown in microgravity versus in those grown at 1 G (changes were 53–71%). These results confirm that the past reported gene and protein expression changes for C. elegans during spaceflight are not unique to specific operational constrains or diet, and are owing to microgravity. In addition to alterations in cytoskeletal genes we have observed reproducible changes in metabolic genes including sirtuin, which is also known to influence ageing. Consistent with the gene and protein expression changes we also found lower fat accumulation and shorter body length in the microgravity-exposed worms. Last, alterations in the movement of the microgravity worms were observed. These results demonstrate a reproducible set of C. elegans gene and protein expression changes in response to microgravity and provide the basis for future mechanistic studies of how microgravity impacts muscle alteration and metabolism in C. elegans and possibly astronauts.

Results

Proteomic and transcriptomic analysis of space-flown C. elegans

5. To identify proteins that were differentially expressed in the nematodes during spaceflight, we quantitatively analyzed the expression levels of 475 proteins by matrix-assisted laser desorption/ionization time-of-flight tandem mass spectrometry. This analysis revealed significantly increased expression of 16 proteins and significantly decreased expression of 43 proteins in microgravity (P ≤ 0.05). Of the 16 proteins with increased expression, the expression of ASP-1 (aspartic protease) was increased 1.89-fold (log₂[μG/1 G] = 0.92) with the remaining proteins only slightly increased; these include proteins involved in protein synthesis such as ribosomal proteins and translation elongation factors (Figure 1). Gene expression analysis confirmed the downregulation of muscle-related proteins such as the myosin heavy chains, troponins, and intermediate filaments in the microgravity-cultured worms (Figure 1). Importantly, the pattern of downregulation of expression of muscle genes such as myosin heavy-chain genes myo-3 (log₂[μG/1 G] = –0.89) and unc-54 (log₂[μG/1 G] = –0.49) as well as the paramyosin gene unc-15 (log₂[μG/1 G] = –0.62) were reproducibly observed in both the current experiment and the previous flight experiment.
6. Other cytoskeletal components also displayed decreased expression during culture in microgravity, for example ACT-5 (actin), ATN-1 (α-actinin), DEB-1 (vinculin), IFB-2 (intermediate filament), and ANC-1 (nuclear and mitochondrial anchorage protein). In addition, significantly reduced levels of metabolic proteins were observed during culture in microgravity, for example, components involved in glycolysis (GPD-3), gluconeogenesis (PCK-1: phosphoenolpyruvate carboxykinase), and the glyoxylate cycle, a variation of the tricarboxylic acid (TCA) cycle (GEI-7). Moreover, the levels of components of the electron transport chain (SDHA-1) and the TCA cycle (ACO-2 and CTS-1) also significantly decreased during spaceflight. DNA microarray analysis confirmed these decreased protein expression levels in response to microgravity and suggested other energy metabolism gene expression level changes in microgravity. For example, genes encoding NADH dehydrogenase (complex I) and succinate dehydrogenase (complex II) displayed lower gene expression levels in the worms cultured in microgravity versus those cultured on the 1-G centrifuge (complex I: \( \log_{2}(\mu G/1 \, G) = -0.18 \) to \(-1.03\), complex II: \( \log_{2}(\mu G/1 \, G) = -0.56 \) to \(-0.76\)). Similarly, ATP synthase expression was down (\( \log_{2}(\mu G/1 \, G) = -0.38 \) to \(-0.76\)).

7. Whereas DNA microarray analysis suggests that major muscle components, cytoskeletal elements, metabolic genes, and mitochondrial electron transport genes largely are downregulated in microgravity, some genes in these broad classes appear to be upregulated. Notably, a sirtuin gene, \( \text{sir-2.1} \), encoding SIRT-1 protein, was upregulated. Sirtuin proteins deacetylate histones and several transcriptional factors, resulting in the activation or repression of target genes, and the sirtuin family may act as a global regulator of tissue health in response to diet and other stimuli. It was reported that \( \text{sir-2.1} \) is involved in longevity and anti-aging of \( \text{C. elegans} \), and that \( \text{abu-6, abu-7, and pqn-5} \) are downstream targets that are negatively regulated by \( \text{sir-2.1} \). Our microarray data indicate not only that the expression level of \( \text{sir-2.1} \) significantly increases in microgravity but also that the downstream target gene expression levels significantly decrease under microgravity condition; notably, significant changes in the same directions of expression alteration were also noted on our previous flight. Real-time quantitative PCR (qPCR) analysis confirmed the increased expression of \( \text{sir-2.1} \) and the decreased expression of downstream genes, which are negatively regulated by \( \text{sir-2.1} \), including \( \text{abu-6, abu-7, and pqn-5} \).
Body length and fat accumulation of nematodes cultured in microgravity

8. As proteomic and microarray analyses demonstrated decreased muscle and metabolic gene expression in microgravity, body lengths of a small subset of worms not used for omic analyses were microscopically measured. The body length of worms cultured in microgravity were slightly but significantly decreased by ~5.5% versus worms cultured on the centrifuge (μG: 1.37 ± 0.053 mm, 1 G: 1.45 ± 0.094 mm, n = 15 worms per group, P ≤ 0.05; Figure 2). The data from the omics analyses suggest that the space-flown worms had lower energy metabolism capacity. Several molecules involved in fat metabolism are downstream targets of sirtuin signaling. Our DNA microarray analyses indicated that microgravity induced the decreased expression of fat genes encoding fatty acid desaturases and lbp genes that are involved in lipid binding activity (Figure 3c). The sir-2.1 downstream target genes fat-7 and lbp-6 were among the downregulated transcripts (log₂[μG/1 G] = −0.38 (P = 0.01) and −0.47 (P = 0.00), respectively). Therefore, we assessed lipid stores in a small subset of worms not used for omic analysis. Sudan Black staining indicated that the accumulation of fat in microgravity-cultured nematodes was significantly reduced compared with 1-G cultured worms (Figure 3a,b).

Figure 2

Alteration of body length of space-flown C. elegans. (a) Microscopic image of worms grown on the 1 G centrifuge for 4 days. (b) Microscopic image of worms grown in microgravity for 4 days. The worms in both conditions had normal levels of eggs in their bodies. (c) The mean of body length of the worms grown at 1 G was 1.45 ± 0.09 mm, and for microgravity was 1.37 ± 0.05 mm, respectively (n = 15, means ± s.d.). **P ≤ 0.01, Welch’s t-test. Scale bars indicate 0.5 mm.
Altered fat storage in microgravity-cultured *C. elegans*. (a) Images of Sudan Black staining of accumulated fat in *C. elegans*. Worms grown onboard the 1 G centrifuge (upper image) and in microgravity (lower image) are displayed. Scale bars indicate 100 μm. There was less fat accumulation in microgravity-cultured worms compared with 1 G controls. (b) Density measurements of Sudan Black stained worms (as described in Methods). The mean densities were 135.36 ± 28.12 in microgravity-cultured worms and 176.55 ± 27.61 in 1-G cultured worms (means ± s.d.). *P* ≤ 0.05, Student’s *t*-test. (c) Alteration of fat-related gene expression determined by microarray analysis. *P*-values as indicated in the panel, Student’s *t*-test.

**Effect of microgravity on swimming behavior of *C. elegans***

9. To examine the swimming behavior changes of *C. elegans* during spaceflight, we analyzed the swimming motion of worms grown under microgravity or 1 G on the ISS for 4 days. As shown in Table 1, wavelength showed no difference between microgravity and 1-G cultured worms. However, frequency of swimming was significantly different, and this likely caused a significant difference in wave velocity. Amplitude was measured at the point of 0.1 L, and no significant difference was observed. These results suggest that microgravity induced lower beating frequency and slower wave velocity without changing the shape feature of movement, i.e., the movement of the worm became slower under microgravity.

Discussion

10. It is well known that microgravity exerts considerable effects on physiological processes. Muscle atrophy is one of the main concerns for astronauts during spaceflight. To counter atrophy, astronauts are forced to perform several exercises such as using an ergometer. In 2004, we had the opportunity to conduct an experiment using the nematode *C. elegans* on the ISS. Nematodes flown in microgravity for ten days exhibited reduced gene expression of muscle-related molecules. Both gene and protein expression levels of myosin heavy chain and paramyosin, main components of thick filaments in invertebrates, significantly decreased in space-flown worms. In the present study, we also observed lower expression levels of both the major components for myofilament assembly such as myosin heavy chain and paramyosin. This repeated observation suggests that these changes are caused by spaceflight and not operational, technical, or dietary differences between these two spaceflight experiments.

Unit 5 - Mark scheme

Question number

Answer

Mark

1(b)(i)
An explanation that includes any two of the following points:

 no ATP will be produced by the electron transport chain (1)
 because electrons will not be passed onto the oxygen (1)
 therefore {reduced NAD will not be reoxidised / the electron transport chain will stop} (1)

(2)

1(b)(ii)
An explanation that includes the following points:

 there will be no ATP production from reduced NAD (1)
 there will be some ATP produced from reduced FAD because electrons from reduced FAD enter the electron transport chain after the site of inhibition of rotenone (1)

(2)

1(b)(iii)
An explanation that includes the following points:

 because the inhibitors affect the ETC, which is not used in anaerobic respiration (1)
 therefore the same quantity of ATP will be produced from substrate level phosphorylation in glycolysis (1)

(2)

2
(a)(i)
D chemoreceptor, medulla oblongata (1)

### 1(b)(i)

An explanation that includes any two of the following points:

- no ATP will be produced by the electron transport chain (1)
- because electrons will not be passed onto the oxygen (1)
- therefore {reduced NAD will not be reoxidised / the electron transport chain will stop} (1)  

(2)

### 1(b)(ii)

An explanation that includes the following points:

- there will be no ATP production from reduced NAD (1)
- there will be some ATP produced from reduced FAD because electrons from reduced FAD enter the electron transport chain after the site of inhibition of rotenone (1)  

(2)

### 1(b)(iii)

An explanation that includes the following points:

- because the inhibitors affect the ETC, which is not used in anaerobic respiration (1)
- therefore the same quantity of ATP will be produced from substrate level phosphorylation in glycolysis (1)  

(2)

### 2(a)(i)

D chemoreceptor, medulla oblongata  

(1)
2(a)(ii) An explanation that includes any four of the following points:

- an increase in blood carbon dioxide decreases the pH of the blood (1)
- the pH of the blood needs to be kept within narrow limits (1)
- therefore the ventilation rate has to increase (1)
- nerve impulse sent from [respiratory centre / medulla] to intercostal muscles (1)
- when inspiratory centre is stimulated, the expiratory centre is inhibited (1)

Accept cells have to be supplied with sufficient oxygen / carbon dioxide has to be removed

2(b) An answer that includes the following points:

- This apple releases ethene (1)
- these apples will release more ethene (1)
- more apples will ripen (1)

Accept converse

3(a) Example of calculation:

\[ \frac{58 - 1}{100} = 0.95 \]

\[ \frac{350 \times 0.95}{100} = 33.25 \]

| 4(b)(ii)        | An answer that includes three of the following points: similarities:  
• contain \{actin / myosin / tropomyosin / troponin\} (1)  
• consist of \{sarcoplasm / sarcolemma / sarcomeres\} (1)  

differences:  
• slow-twitch muscle fibres have more mitochondria (1)  
• slow-twitch muscle fibres have more myoglobin (1)  
• slow-twitch muscle fibres have less glycogen (1)  
• slow-twitch muscle fibres have less creatine phosphate (1) | To gain maximum marks, at least one similarity must be included in the answer | (4) |

Accept the converse points for fast-twitch fibres
Answers will be credited according to candidate's deployment of knowledge and understanding of the material in relation to the qualities and skills outlined in the generic mark scheme.

The indicative content below is not prescriptive and candidates are not required to include all the material indicated as relevant. Additional content included in the response must be scientific and relevant.

**Indicative content**

- power output is (always) greater in muscles containing more than 50% fast-twitch muscle fibres
- power output in muscles containing more than 50% fast-twitch muscle fibres increases with speed of contraction.
- power output in muscles containing less than 50% fast-twitch muscle fibres decreases with higher speeds of contraction.
- fast-twitch muscles are designed for rapid short bursts of energy.
- therefore power output will increase with speed of contraction.
- because they are adapted for anaerobic respiration.
- example of adaptation described
- muscles with low content of fast-twitch muscles cannot sustain aerobic respiration for long periods of time

..................................................................................................................
2 The photograph shows *Daphnia*, a freshwater animal.

![Daphnia](image)

*Daphnia* is transparent and the heart can be seen beating.

A student investigated the effect of caffeine concentration on the heart rate of *Daphnia*.

The student selected five *Daphnia*: A, B, C, D and E. The student measured the heart rate, in beats per minute (bpm), of each *Daphnia* in water.

This was repeated using five different concentrations of caffeine solution: 0.1%, 0.5%, 1.0%, 2.0% and 5.0%.

<table>
<thead>
<tr>

<td>285</td>
<td>278</td>
<td>286</td>
</tr>
</tbody>
</table>

(a) Calculate the mean heart rate (bpm) for the 5.0% caffeine concentration.

Answer................................................ bpm 196
The table shows the data from this investigation.

<table>
<thead>
<tr>
<th>Daphnia</th>
<th>Concentration of caffeine (%)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0.0</td>
</tr>
<tr>
<td>A</td>
<td>176</td>
</tr>
<tr>
<td>B</td>
<td>178</td>
</tr>
<tr>
<td>C</td>
<td>184</td>
</tr>
<tr>
<td>D</td>
<td>172</td>
</tr>
<tr>
<td>E</td>
<td>182</td>
</tr>
<tr>
<td>mean heart rate / bpm</td>
<td>178</td>
</tr>
</tbody>
</table>

(a) Calculate the mean heart rate (bpm) for the 5.0% caffeine concentration.   

Answer................................................ bpm
(b) Plot a suitable graph to show the effect of caffeine concentration on the mean heart rate of *Daphnia.*
(c) State a suitable null hypothesis for this investigation.

..........................................................................................................................
..........................................................................................................................
..........................................................................................................................
..........................................................................................................................

(d) Explain one ethical reason why the student chose to use *Daphnia* for this investigation.

..........................................................................................................................
..........................................................................................................................
..........................................................................................................................
..........................................................................................................................
(e) The student used a statistical test to investigate the significance of the correlation between the mean heart rate and the caffeine concentration.

To calculate the correlation coefficient, the student produced the following table.

<table>
<thead>
<tr>
<th>Caffeine concentration % (a)</th>
<th>Mean heart rate (b)</th>
<th>Rank a</th>
<th>Rank b</th>
<th>d</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.0</td>
<td>178</td>
<td>1</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>0.1</td>
<td>261</td>
<td>2</td>
<td>3</td>
<td>-1</td>
</tr>
<tr>
<td>0.5</td>
<td>258</td>
<td>3</td>
<td>2</td>
<td>1</td>
</tr>
<tr>
<td>1.0</td>
<td>267</td>
<td>4</td>
<td>4</td>
<td>0</td>
</tr>
<tr>
<td>2.0</td>
<td>275</td>
<td>5</td>
<td>5</td>
<td>0</td>
</tr>
<tr>
<td>5.0</td>
<td></td>
<td>6</td>
<td>6</td>
<td>0</td>
</tr>
</tbody>
</table>

(i) Calculate the correlation coefficient, $r_s$, using the formula:

$$r_s = 1 - \frac{6 \sum d^2}{n(n^2 - 1)}$$

Where:

$\Sigma =$ the sum of
$\quad d =$ the difference between each pair of ranks
$\quad n =$ the size of the sample (number of pairs of values)

Answer: 

(ii) The table shows some critical values for this statistical test.

<table>
<thead>
<tr>
<th>Number of pairs of values</th>
<th>Level of significance (p)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0.10</td>
</tr>
<tr>
<td></td>
<td>0.05</td>
</tr>
<tr>
<td></td>
<td>0.01</td>
</tr>
<tr>
<td>4</td>
<td>1.000</td>
</tr>
<tr>
<td>5</td>
<td>0.900</td>
</tr>
<tr>
<td>6</td>
<td>0.829</td>
</tr>
<tr>
<td>7</td>
<td>0.714</td>
</tr>
<tr>
<td>8</td>
<td>0.643</td>
</tr>
<tr>
<td>9</td>
<td>0.600</td>
</tr>
<tr>
<td>10</td>
<td>0.564</td>
</tr>
</tbody>
</table>

Explain how the student could use the graph and the statistical test to draw conclusions from this investigation.

</tr>
</tbody>
</table>

Explain how the student could use the graph and the statistical test to draw conclusions from this investigation.

(Total for Question 2 = 16 marks)
Germinating cereal grains, such as barley, produce the enzyme amylase. The production of amylase is affected by gibberellin, a plant growth regulator. A student formed the following hypothesis.

The higher the concentration of gibberellin, the greater the production of amylase by germinating cereal grains.

Plan an investigation to test this hypothesis.

(a) State two safety issues you would need to take into account.

..........................................................................................................................
..........................................................................................................................
..........................................................................................................................
..........................................................................................................................
..........................................................................................................................

</table>
| 2(d)           | An explanation that includes the following points:  
- simple nervous system (1)  
- so less likely to suffer {pain / stress} (1) or  
- abundant in nature (1)  
- so not affecting food chain (1) | Accept invertebrate nervous system | (2) |
| 2(e)(i)        | • calculate the value of $d^2$ (1)  
• calculate the value of $6\Sigma d^2$ (1)  
• calculate the value of $r_s$ (1)  
Example of calculation:  
$\Sigma d^2 = 2$  
$6\Sigma d^2 = 12$  
$r_s = 0.943$ | Allow ecf from first or second marking point  
Correct answer with no working shown gains full marks | (3) |
| 2(e)(ii)       | An explanation that includes any five of the following points:  
- as caffeine concentration increases, heart rate increases (1)  
- critical value is 0.886 (1)  
- calculated value (0.943) is higher than critical value (1)  
- therefore reject the null hypothesis (1)  
- there is a significant positive correlation between concentration of caffeine and heart rate (1)  
- low concentrations have a large effect, higher concentrations give a smaller increase (1) | | (5) |

### Question number 3(d)

**Answer**

A description that includes the following points:

- table with headings (1)
- means calculated from repeats (1)
- {scatter / line} graph format with labelled axes (1)
- use of an appropriate statistical test (1)

**Additional guidance**

For example, (Pearson's) correlation coefficient or Spearman's rank

**Mark** (4)

### Question number 3(e)

**Answer**

An answer that includes any three of the following points:

- difficult to control {all variables / or a named variable} (1)
- another factor may be limiting effect of growth regulator (1)
- possible contamination with {bacteria / fungi} (1)
- more than one growth regulator may be involved (1)

**Mark** (3)
