You must have:

Mathematical Formulae and Statistical Tables (Blue)

Total Marks

--

Candidates may use any calculator allowed by the regulations of the Joint Council for Qualifications. Calculators must not have the facility for symbolic algebra manipulation, differentiation and integration, or have retrievable mathematical formulae stored in them.

Instructions

- Use **black** ink or ball-point pen.
- If pencil is used for diagrams/sketches/graphs it must be dark (HB or B). Coloured pencils and highlighter pens must not be used.
- **Fill in the boxes** at the top of this page with your name, centre number and candidate number.
- Answer **all** questions and ensure that your answers to parts of questions are clearly labelled.
- Answer the questions in the spaces provided – *there may be more space than you need.*
- You should show sufficient working to make your methods clear. Answers without working may not gain full credit.
- Values from the statistical tables should be quoted in full. When a calculator is used, the answer should be given to an appropriate degree of accuracy.

Information

- The total mark for this paper is 75.
- The marks for **each** question are shown in brackets – *use this as a guide as to how much time to spend on each question.*

Advice

- Read each question carefully before you start to answer it.
- Try to answer every question.
- Check your answers if you have time at the end.

PEARSON

1. A tennis club's committee wishes to select a sample of 50 members to fill in a questionnaire about the club's facilities. The 300 members, of whom 180 are males, are listed in alphabetical order and numbered 1 – 300 in the club's membership book.

The club's committee decides to use a random number table to obtain its sample. The first three lines of the random number table used are given below.

319 952 241 343 278 811 394 165 008 413 063 179 749
722 962 334 461 267 114 806 992 414 837 837 657 339
470 684 554 127 067 459 142 920 144 575 311 605 412

Starting with the top left-hand corner (319) and working across, the committee selects 50 random numbers. The first 2 suitable numbers are 241 and 278. Numbers greater than 300 are ignored.

- (a) Find the next two suitable numbers. (1)

When the club's committee looks at the members corresponding to their random numbers they find that only 1 female has been selected. The committee does not want to be accused of being biased towards males so considers using a systematic sample instead.

- (b) (i) Explain clearly how the committee could take a systematic sample.
(ii) Explain why a systematic sample may not give a sample that represents the proportion of males and females in the club. (3)

The committee decides to use a stratified sample instead.

- (c) Describe how to choose members for the stratified sample. (3)
(d) Explain an advantage of using a stratified sample rather than a quota sample. (1)

6. Eight tasks were given to each of 125 randomly selected job applicants. The number of tasks failed by each applicant is recorded.

The results are as follows

Number of tasks failed by an applicant	0	1	2	3	4	5	6 or more
Frequency	2	21	45	42	12	3	0

- (a) Show that the probability of a randomly selected task, from this sample, being failed is 0.3 (2)

An employer believes that a binomial distribution might provide a good model for the number of tasks, out of 8, that an applicant fails.

He uses a binomial distribution, with the estimated probability 0.3 of a task being failed. The calculated expected frequencies are as follows

Number of tasks failed by an applicant	0	1	2	3	4	5	6 or more
Expected frequency	7.21	24.71	37.06	r	17.02	5.83	s

- (b) Find the value of r and the value of s giving your answers to 2 decimal places. (3)
- (c) Test, at the 5% level of significance, whether or not a binomial distribution is a suitable model for these data. State your hypotheses and show your working clearly. (8)

The employer believes that all applicants have the same probability of failing each task.

- (d) Use your result from part(c) to comment on this belief. (1)
