Unit P302

Topic: Effect of Human Traffic on Biodiversity of a Marsh.

AO1

A narrow question is identified and developed with a clear rationale given interest in the local area. The plan is clear and there are detailed timings presented in the Proposal Form. High levels of organisational activity are shown and excellent records kept with adjustments being made to the original plan

– High Band 3

AO2

A wide range of consistently referenced sources are used. Data collection techniques are successfully implemented in 10 different sites, showing an extensive commitment and effort. The area map identifies these and makes the Field Study target area clear. Information from sources is well synthesised and detailed links established. There is however a lack of evidence of critical selection and analysis of sources which just shades the mark awarded

– High Band 3

AO3

The whole project is very well structured and synthesised. Technical terms and language are used well. Though information is logically presented, some further structure to the overall layout would aid readability. An excellent understanding of the topic is shown. The original hypothesis is mathematically tested and analysed and importantly its statistical significance addressed. Clear conclusions are drawn with suggestions for further work

– High Band 3

AO4

A very high level of insight and self-awareness is shown in evaluating the project journey. Explanations are justified and perceptive conclusions drawn. An excellent presentation was obviously given and useful feedback received

– High Band 3
